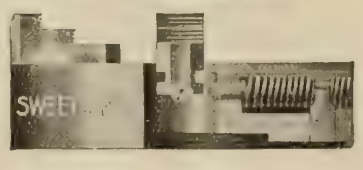
There

SKINNER CHUCKS
ARE USUALLY FOUND

There are many reasons why—our illustrated literature makes most of them evident. May we send it?

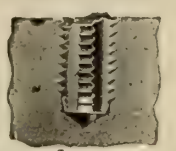


THE SKINNER CHUCK CO.
New Britain, Conn.

New York Office: 94 Reade St.
San Francisco Office: Rialto Bldg.
London Office: 139 Queen Victoria St., London, E. C. 4.

SWEETLAND CHUCKS

Our Independent Lathe Chuck which stands for three-score years of mechanical endeavors. The gripping and gearing surfaces, both of hardened steel, are ground perfectly true. The large screws of special grade steel are flush with the body of this Sweetland Independent Lathe Chuck. The strong jaws are high-grade steel, properly hardened. Sweetland Chucks, whether they are Independent Geared, Scroll, Universal or Combination, increase production.



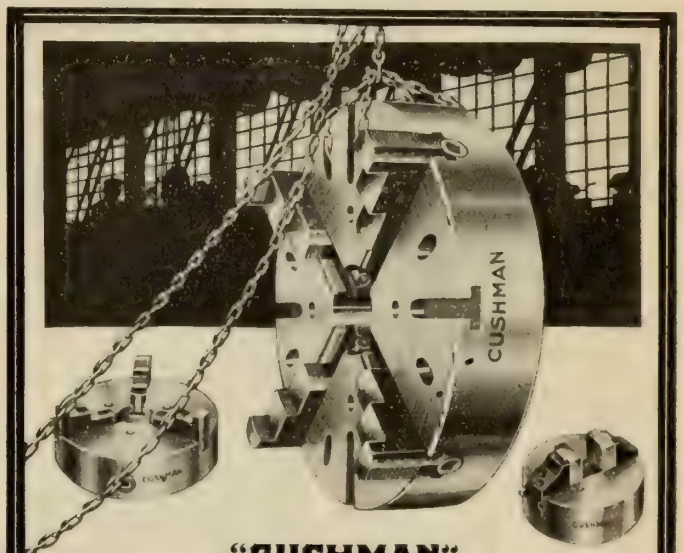
Our 12C Catalogue is yours for the asking

THE HOGGSON & PETTIS MFG. CO.
NEW HAVEN, Connecticut, U.S.A.
Sold by Geo. F. Foss Machinery & Supply Company, Limited
305 St. James St., Montreal

Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some make-shift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy



And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself.

Write.

The Walton Co.
Hartford, Conn.

"CUSHMAN" CHUCKS

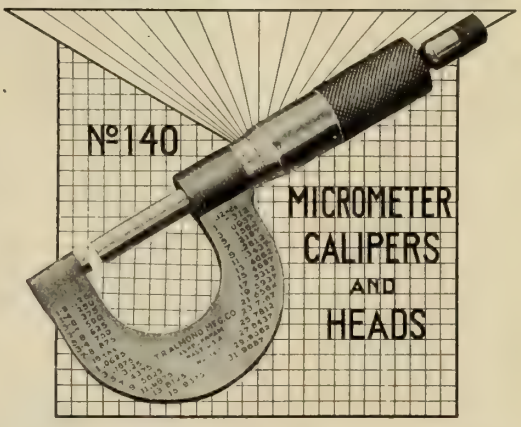
ALL STEEL
INDEPENDENT CHUCKS



are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.

THE UNION STEEL BODY CHUCKS
are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

The Mechanic Knows

The workman expects Jacobs as the drill chuck on his machine. He knows it does not break drills, that the toothed sleeve and key make adjusting easy and safe.

Are your machines Jacobs equipped?

THE JACOBS MFG. CO. HARTFORD, CONNECTICUT, U.S.A.

OIL GAS FOR HEAT

Our engineers are specialists in the design of industrial furnaces. They study your furnace problems and build a furnace that will give the most economical results on that particular class of work. We control basic patents covering the conversion of oil into gas and burning it as a superheated natural gas in your furnace and by the application of this process we can cut your furnace operating costs in two. Consult us now. It will save you money.

GENERAL COMBUSTION COMPANY OF CANADA, LIMITED, MONTREAL

"Experts in economical combustion of liquid fuels"

Hoyt Babbitt Metals give Maximum Service in the Work for which they are intended

Three HOYT METAL babbitts — "Frost King," "Trojan" and "Nickel Genuine" — ranging from a metal which keeps wheels turning in the coldest weather known, to a hard babbitt which stands up under the extreme heat of foundries and glass works.

Compounded scientifically to be exactly suited to their purpose. Give consistent satisfaction because they are mixed with scrupulous accuracy and care.

When you have trouble with bearing metals, let us show you the remedy.

KEMPSMITH No. 4 Plain Maximiller

Single Pulley Drive

Equipment—1¾ inch arbor, two arbor supports, brace, No. 4 Plain Vise and all necessary crank handles, wrenches, and accessories as shown.

The Kempsmith No. 4 Plain Maximiller has been designed in recognition of the growing demand for a heavier and more powerful machine than the usual cone type miller. It is the product of some twelve years' experimentation by an experienced and thoroughly seasoned organization. In all features of general design, such as weight, rigidity, convenience of operation and efficiency in production we offer this machine as the maximum milling machine of similar rating.

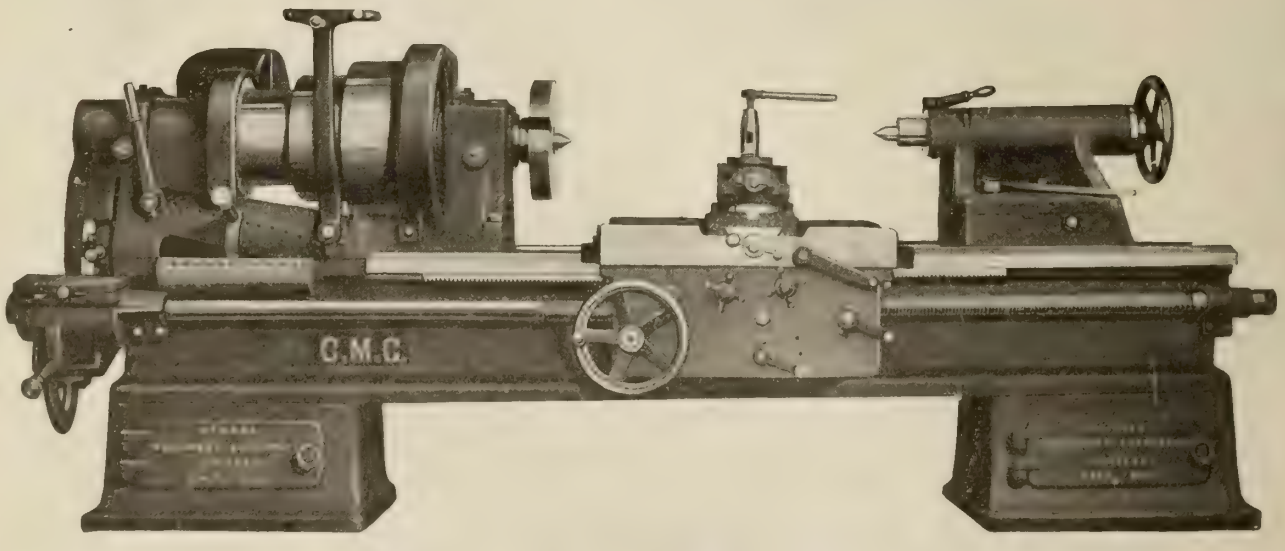
No expense has been spared to incorporate the very highest class of materials obtainable. All gearing stock is purchased to exact chemical analysis and is scientifically heat treated for the particular use to which it is put. Much of the shafting especially that in the speed train is also heat treated alloy steel.

Send for full particulars to

THE GEO. F. FOSS MACHINERY & SUPPLY CO., LIMITED

305 St. James Street - - MONTREAL

HOME MONEY *for* HOME GOODS



When we buy in Canada we retain both the goods and the money—when we buy elsewhere we get the goods—but lose the money.

The discount of ten per cent. and upwards placed upon Canadian funds in New York makes this policy of buying at home of still more pressing importance to all machinery users.

The lathe shown below is a distinctly Canadian product—equal to the best lathe of foreign make. Why pay more for what is no better, if as good?

P & W

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **good** taps —easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Where You Can Buy Them—

New York, 326 Hudson St. **Boston,** 93-95 Oliver St. **Philadelphia,** 405 N. 21st St. **Cleveland,** 730 Superior Ave. **Detroit,** Kerr Machy. Bldg. **Chicago,** 571 W. Washington Blvd. **St. Louis,** 516 N. 3rd St. **Cincinnati,** 336 W. Fourth St. **Birmingham, Ala.,** 2015 First Ave. **St. Paul, Minn.,** Robinson, Cary & Sands Co. **New Orleans,** C. T. Patterson Co., Ltd. **San Francisco,** 16 to 18 Fremont St. **In Canada—** Pratt & Whitney Co. of Canada, Ltd., **Dundas, Montreal, Toronto, Winnipeg, Vancouver.**

ST. JOHNS, QUEBEC

The ideal city for manufacturers

Transportation facilities that are unequalled. Seven railroads, including the G.T.R. and C.P.R., pass through the city, giving direct rail connection to any part of Canada and the Eastern States. Montreal docks, with trans-Atlantic shipping, are but 27 miles distant. Located on the Richelieu River, a link in the chain of waterways connecting New York and the Eastern Seaboard with the Great Lakes.

The cheapest labor market in Canada—for skilled and unskilled labor. Situated in the most densely populated district in the Dominion. An unusually low cost of living has been maintained, and labor troubles are unknown.

A number of industrial sites with remarkable advantages are available. They are suitably located in relation to all public conveniences and offer ample room for future expansion.

St. Johns offers unique inducements to new industries. Fifteen years' exemption from taxes with period subject to extension; all public conveniences and additions to them as required; 5% cash bonus to you on your payroll for five years, which will be advanced to you if you wish for the purchase or erection of any building suitable to your purpose.

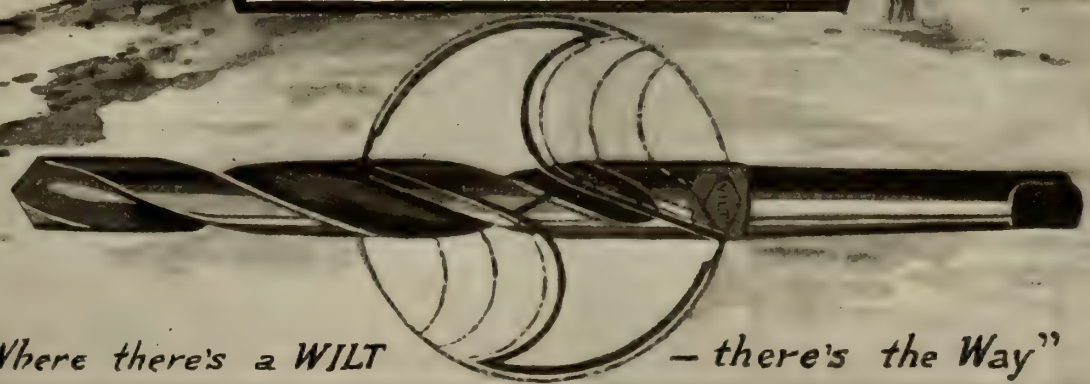
WILT

HIGH SPEED AND CARBON TWIST DRILLS

REAMERS AND MILLING CUTTERS

Quality First

The Keystone Upon Which All WILT Products Are Built



A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters.** **WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

SPEED UP

With "Little David" Pneumatic Grinders

This cut shows a "Little David" Portable Grinder at work on an automobile crankcase—grinding the cylinder holes.

Perhaps you don't make automobiles, but if your product is made of metal it will pay you to use "Little David" Grinders in your foundry, machine shop and erecting floor.

They are light in weight, speedy and powerful in operation, and consume less air than any other portable grinder on the market.

"Little David" Grinders and other members of this labor-saving family are now *"Made-in-Canada."*

Our nearest branch has the latest "Little David" bulletins

GARVIN MACHINE TOOLS

Garvin
Die Slotting
Machine

Service

When you purchase a Garvin machine tool you provide yourself with a means of production in which you can place absolute confidence. It will serve you well and faithfully, with a minimum amount of attention and upkeep.

Garvin machine designs are fundamentally correct—proven so by the fully satisfactory service rendered in plants the country over—workmanship is precise and checked to an exacting standard. Operating economy is second to none. *You can safely trust your product's reputation for accurate machining to Garvin machine tools.*

THE JOHNSON FRICTION CLUTCH

Standard Single Clutch with Pulley Mounted on Hub

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

Does the Work of From Twenty to Thirty Men

NO matter what you handle, it will pay you to consider the use of a Link-Belt Crane—if you desire low handling costs and high efficiency.

It does'nt pay to employ hand labor for moving any materials nowadays that can be handled with greater speed and economy by machinery.

One man and a Link-Belt Crane can unload all your materials, store your coal, switch your cars and do many other jobs. If you now had a crane, we venture the prediction that you would not part with it for considerably more than you paid for it.

Write for Crane Catalog No. 370.

Nichrome Castings

TRADE D-H MARK

For Heat Treatment

Uniform Heat Treating Results at Lower Cost

Dependable Quality is the prime essential in heat treated products. To get that quality uniformly high calls for uniform application of the heat.

Nichrome containers conduct the heat uniformly and readily over a long period of time—because the walls are thin and because Nichrome castings do not warp, "grow," crack or scale under repeated heating and cooling.

At 1800° F., Nichrome Castings give thousands of hours of service. Your economy is assured by a Nichrome *guarantee.*

The Driller for Exact Work

HOEFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

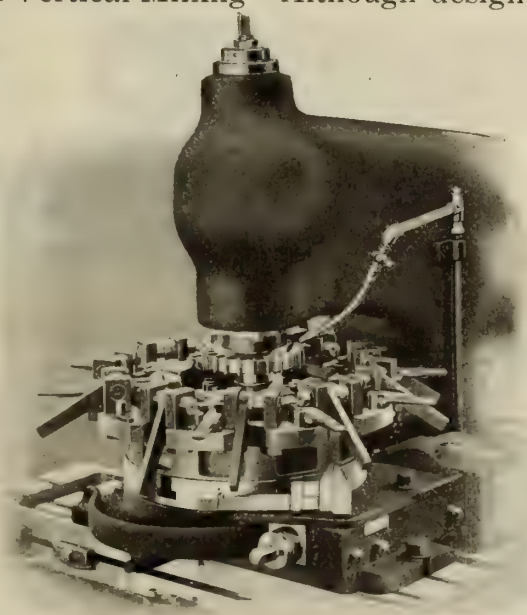
Milwaukee Vertical Milling Machines



Capable of Doing Heavy Work Accurately

The Vertical Milling Machine Construction, in which both spindle and knee are adjustable, is a relic of the days when a milling cutter was regarded as scarcely more than a coarse file and when machines were light and delicate.

In these days of heavy work on Vertical Milling Machines, this duplication of adjustment is detrimental to the rigidity of the machine as well as unnecessary.

The Milwaukee Vertical Milling Machine is built with adjustable knee and with spindle adjustable only to wear. This construction is decidedly rigid and can always be relied upon to maintain correct alignment.

Adjustment sufficient for all practical purposes can be secured by adjusting the knee alone, and the adjustable knee is much better suited to withstanding the cutting strains than an adjustable head would be.

OUR POINT ILLUSTRATED

Continuous milling of 6l-inch adjustable wrenches on a Milwaukee Vertical Milling Machine. These parts are turned out at the rate of 3,000 a day and the finished surface bears a constant and accurate relation to other selected points on the part. The cutters are always in the cut. The table revolves and the operator simply keeps chucking new pieces, removing the finished ones.

ROTARY TABLE AND CONTINUOUS MILLING

Although designed and built primarily for the regular line of work which is best adapted to the Vertical Milling Machine, because of the ease of chucking, the design of both the machine and the rotary table takes into account the large quantity of work that can be milled in connection with the rotary table by the continuous milling process, whereby the cutters are always in the cut and remarkable results accomplished. Write for catalogue and get the full facts concerning these machines and also Milwaukee Horizontal Milling Machines.

Even the common or garden variety of job shows profit with the Smalley-General Thread Miller

MATERIAL—Ground Shafting.
LATHE TIME—25 minutes a piece, approx.
THREAD MILLER TIME—2½ minutes a piece, floor to floor.

You've probably got a dozen like this in your shop. It's the sort of job you do naturally in the lathe if you don't think it over carefully.

If you are doing this work on the lathe, we're sure you won't continue when we tell you that an intelligent, unskilled man on a **Smalley-General Thread Miller** will turn out 10 pieces like this while a skilled man on a lathe turns out 1.

It isn't only in time that the Smalley-General Thread Miller scores over the lathe. The finished threads have an accuracy and finish that can't be obtained on the lathe under manufacturing conditions.

Send us blue prints of any of your threading jobs and we'll give you guaranteed production estimates with the Smalley-General on this work that will surprise you.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Peerless HIGH SPEED

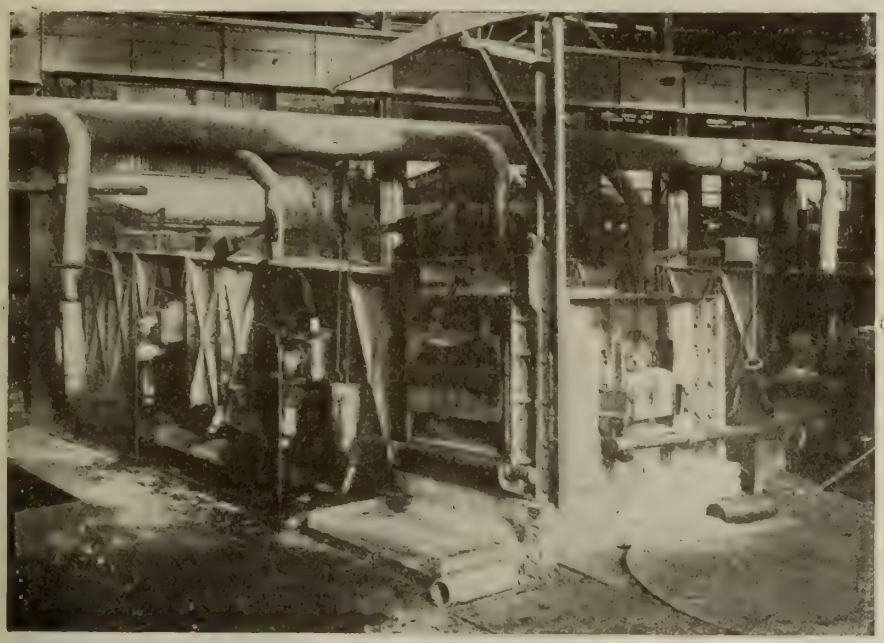
The Standard Metal Saw of TO-DAY

While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TO-DAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

OUR SIX-SPEED GEAR BOX

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.



A trial order at our risk and expense is convincing

Five Diameters Ranging From 9-16 to 1¼ in. on Each Shaft--

with a Norton Grinding Machine

He Completes 45 Shafts Every 9 Hours

Every machinist should know what an amazing variety of cylindrical work can be ground on Norton Grinding Machines at less cost per unit than by any other method.

Here is an example in one of the big Middle West factories of a variety of diameters at low production cost. This operator grinds cold rolled steel shafts for water pumps in automobile engines. In the rough these shafts are in five sizes, running from approximately 9-16 in. to 1¼ in. in diameter; he removes about 0.020 in. stock to secure his diameters and is allowed a tolerance of 0.0005 in. The finish is perfect, yet he finish grinds 45 of these shafts every nine hours. Is there any other process that can compare with this—to say nothing of the high quality of the work?

If your shop does **any** cylindrical work you should get in touch with us at once. Our Service Department will cheerfully furnish information concerning the advantages of cylindrical grinding.

Write us to-day.

"SAFETY FIRST"

ALL-WAY RAILROAD OILERS

are the latest word in their line.

The **flexible spout** makes it possible to oil all places with one "ALL-WAY" whereas previously they could only be reached with force pump cans with specially bent spouts.

Lubricating bearings with the old straight spout oiler often brought the engineer's hands and arms very close to the danger of rapidly revolving gears and flywheels With the "ALL-WAY" the bending of the spout removes this danger. Sizes No. 4, 1 pint—10 in. spout. No. 5, 1 quart—11 in. spout.

Flexible spouts can be furnished for any kind of oiler. If your dealer cannot supply you write us.

We also manufacture the well-known "All-Way" Oil Can—saves you 50% of your oil bill.

Volume XXIII. No. 4. January 22, 1920

Further Examples of Jig and Fixture Work

The Concluding Portion of Article Describing Various Type Fixtures Used in Milling Machine Construction. We Find Herein That a Very Simple Fixture is Often the Solution to Our Interchangeable Problem

By J. H. MOORE, Associate Editor, Canadian Machinery

IN the first portion of this article we described and illustrated six simple jigs used in the manufacture of certain portions of a well-known milling machine. In this, the second and last portion of the article, we will consider other six fixtures used in the making of these machines.

The first to be considered is the worm box jig shown at Fig. 1. This is a fixture of the box type, as can be readily noticed. The worm box is also clearly seen resting on the top of jig. To load the work in the fixture, the plates A and B are first removed. The gear box is placed in jig bottom down until it hits the screw C. The plates are now placed in position. The work is next adjusted by set screws until it comes up to positive stop. The screw C is next tightened, which holds the work securely against the plates A and B, after which the work is drilled. Six holes are drilled in this operation, these being clearly noted on the photograph.

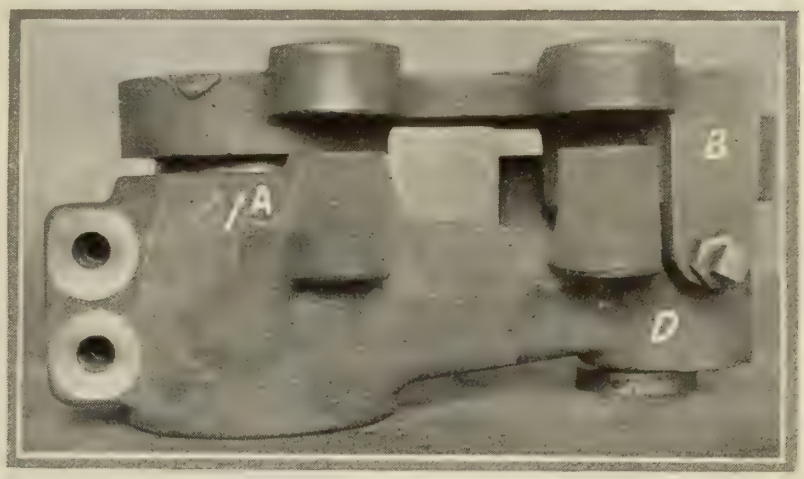

FIG. 3—JIG FOR DRILLING THE OVERARM.

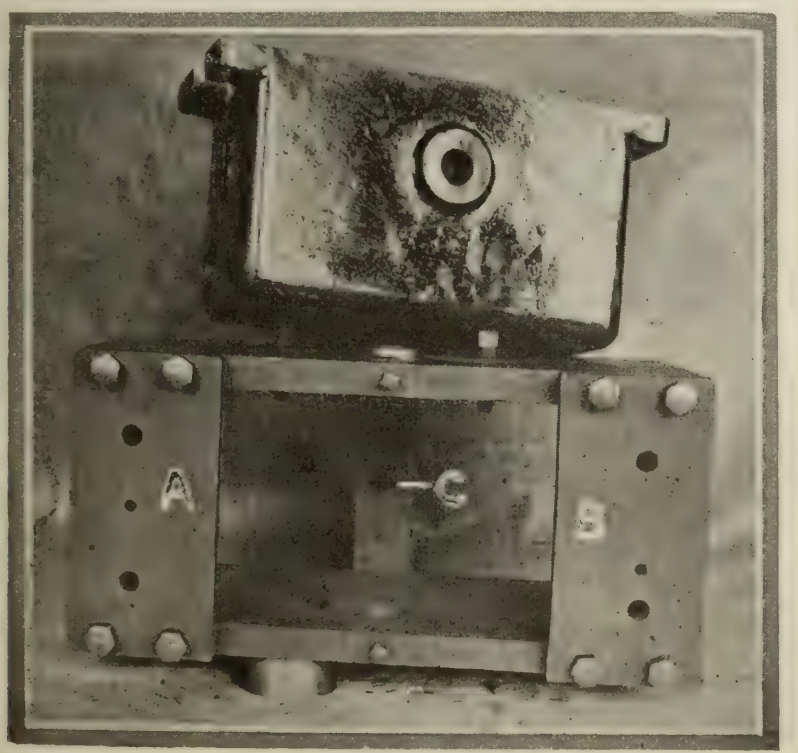

FIG. 1—BOX TYPE OF JIG FOR DRILLING THE WORM BOX.

Gear Lever Jig.

The next fixture is that shown at Fig. 2. The price illustrated at A represents the work which is known as the gear feed box change lever. This is a steel casting, for considerable strains are exerted on this piece while in actual use. Before being ready for this operation, the hole B is finished. The work is now placed in the jig in the following manner: The hole B goes over the stud C, while the portion D rests against the stop E, and is tightened up against the stop by the set screw F. First, a hole is drilled at G, then the jig is turned end for end, and a hole drilled at H. The fixture is now placed on its side, and the two holes drilled through the bushings J and K. In this way four holes are drilled at the one set up. An essential point to watch in a jig of this nature is the importance of having all resting surfaces planed perfectly true and at right angles to each other.

Overarm Jig.

At Fig. 3, we illustrate a jig for drill-

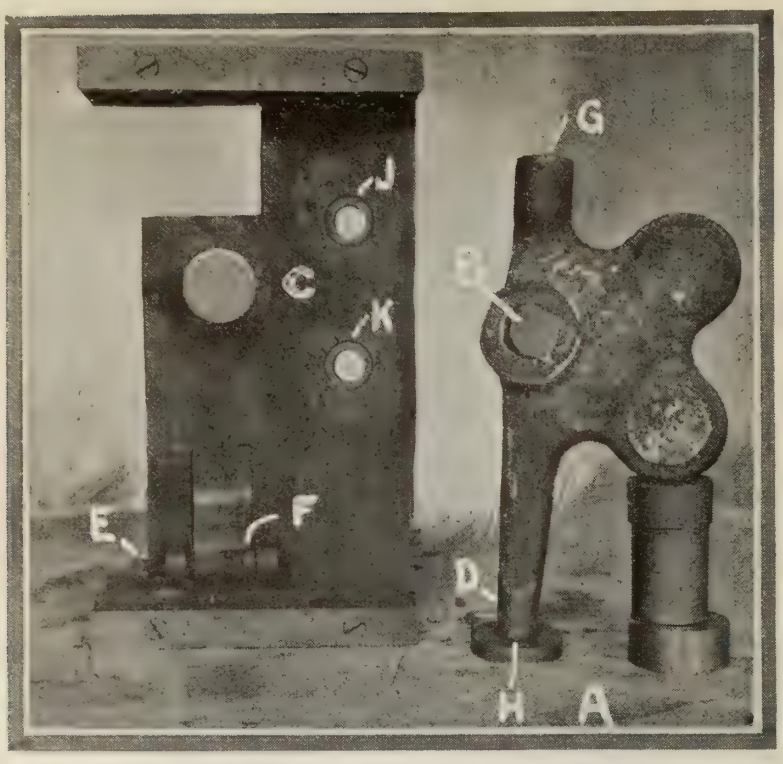

FIG. 2—A SIMPLE BUT EFFICIENT GEAR LEVER JIG.

ing five holes in the overarm steady rest. The idea is very simple. A plug of similar diameter to that of the overarm fits into the finished hole A, while the lug B, with its adjustable stop C, hits up against the boss D. A set screw on the other side tightens up the complete fixture. Five holes are now drilled, four to accommodate the brace, and one to suit the arbor. The remaining details of the fixture are so self-apparent that we leave the reader to study the photograph at his leisure.

Fig. 4 illustrates a double purpose fixture of almost ridiculous simplicity. So simple, in fact, that we hesitated illustrating it, yet it accomplishes its purpose —so why not?

First, it is used for drilling the spring pin hole in the face gear, as shown at A. A plunger of proper diameter fits the bore of the gear and in this way centering the jig, as the distance from the center of this plunger to the center of either bushing is the correct radius necessary.

The bore of the step cone pulley, B, is of similar size to that in the face gear, therefore the same jig is used. In the operation on the pulley the four holes are drilled; drilling two holes at a time. In both these cases, the jig is held securely by means of a long bolt with washer and nut.

Two Other Examples.

The next illustration, Fig. 5, depicts two other drilling jigs.

At A is shown the fixture for drilling the gear guard which goes at the end of miller table. At this operation, it is only desirable to drill the hole B. To accomplish this, a pin of proper diameter is placed into the already finished hole C, which, of course, centres the jig as far as this hole is concerned. The other end is centered by means of adjustable set screws, illustrated on photograph.

The other jig shown at D represents the fixture used to drill the change gear handle bracket. On this operation the piece is placed over the stud E and pulled up to place by means of the nut shown. Adjustment is also obtained from the set screw F. The remainder of the jig is so self-apparent that we make no further comment.

Dividing Head Jig.

A very important portion to any miller is that of the dividing head. For this reason, the drilling of the head must be watched with care. In the illustration shown the head has passed through the operation of drilling the three holes in its side A, B and C. The head is placed in a duplicate base D similar to that used on all dividing heads which passes through the plant. In this way they are assured of accurate results. The base in turn has a groove in it, which slides on the tongue E. This groove is also a duplicate of the size used on the miller table. The complete arrangement is slid into the jig proper, until it hits up against the stop F. The bolt G, and another similar bolt at the other end (but not seen on the photo) is tightened into place, holding everything securely. The jig is now turned up and rests on the faces H and J, which are, of course, machined at right angles to the other face. The one bushing is interchangeable for all the holes drilled.

While none of the fixtures illustrated have been of the complex variety, they have delivered the goods, which is what counts when all is said and done. Of course, in some cases, work, owing to its complex nature, demands a more complicated jig, but where the piece is of a simple type similar to the example shown, there is no necessity of expending more money than is absolutely necessary

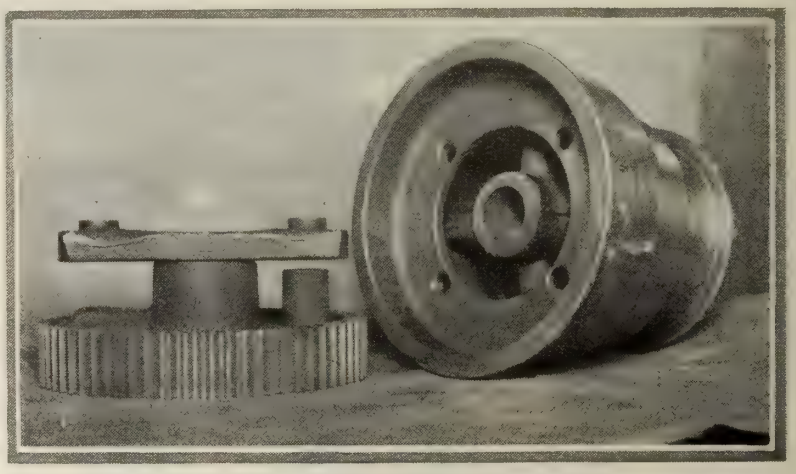

FIG. 4—A DOUBLE PURPOSE SIMPLE JIG.

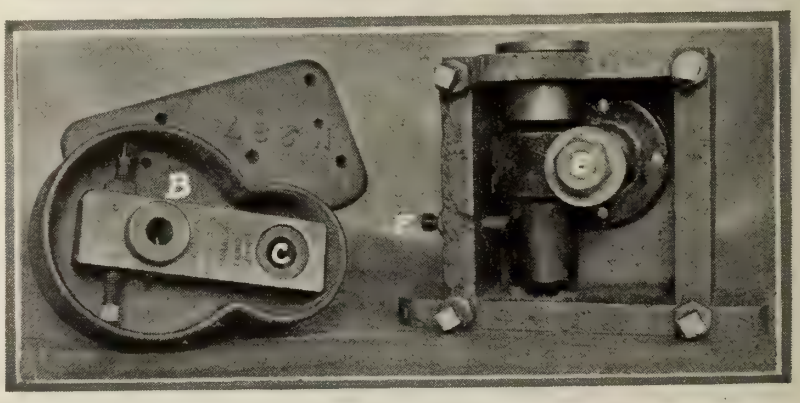

FIG. 5—TWO DIFFERENT JIGS OF SIMPLE DESIGN.

on the fixture. In a later article we shall illustrate some other jigs of a more complex nature.

CHANGES AT CHAPMAN CO.

A DEVELOPMENT and change of considerable importance has taken place at the Chapman Double Ball Bearing Co., Ltd., Toronto, Canada. As readers of CANADIAN MACHINERY are no doubt already acquainted with the well-known line of ball bearing equipment turned out by this firm, we will make no comment on their existing lines, but will first discuss the new position attained by Frank H. Lennox, who formerly had charge of the sales department of this concern.

Mr. Lennox has now been appointed assistant manager, with special duties, which will be explained in detail later on in the announcement.

Previous to coming to Toronto as sales manager for the parent company, Mr. Lennox was assistant sales manager at the United States company, whose plant is situated at Buffalo. He first entered their employ as mechanical engineer, afterwards becoming road engineer, and then sales engineer. He also attended Michigan University, studying engineering in its various phases. He spent a few years with some of the largest manufacturers of ball bearings in the United States. His one source of information and conversation, which never fails, is that of ball bearings, with their proper application.

FRANK H. LENNOX.

Service That Will Be Service

Speaking of the proper application and installation of ball bearings brings us to the second position of our story. It is the intention of this company to create a service in attending to customers' requirements that will have no equal.

In speaking of this service, Mr. Lennox mentioned that what they were particularly anxious to accomplish was this: "To let every manufacturer know of the service, and to have them realize that it was open to them without any obligation on their part."

"In what manner do you propose to supply this information?" we asked.

"By answering any enquiry pertaining to ball bearing installation. You know," continued Mr. Lennox, "in all respect to the average draftsman or designer, they know very little about the proper installation of ball bearing equipment. The subject is a very difficult one, combining various formulae with which only ball bearing manufacturers are conversant. For this reason the proper size of bearing is not actually figured out, but guessed at. Such a condition does not produce maximum efficiency, but far from it.

"Then, again, the subject of proper protection against dust is seldom considered as it should be, and as anyone can understand, this is a most important point, for without the proper protection, the bearing cannot deliver the best results.

"We have often found the following condition to exist: A manufacturer decides to install a ball bearing installation in some portion of his product. His designer goes to work, drafts up his idea of what the installation should be, and sends us the result, with a request to state cost of such an installation.

"As a general rule, we are forced to reply that the design, as shown, is not what it should be, submitting to the firm a new layout at a reduced cost to the manufacturer.

"The unfortunate part, however, is this, that the firm concerned may have, in the meantime, proceeded with their pattern changes, thus necessitating a further change to our corrected design. This condition holds good in practically all the proposed layouts sent in for our approval.

"It is such a state of affairs that we hope and intend to overcome. Our trained staff of expert designers allow us to feel assured that such a condition can be stamped out, if, in turn, we receive co-operation from the various manufacturers."

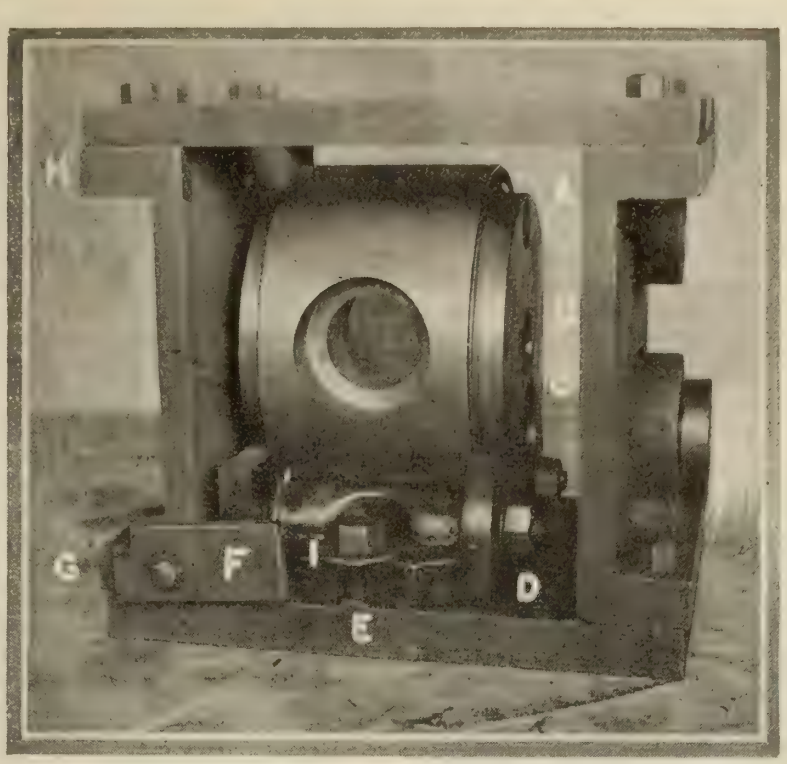

FIG. 6—THE DRILLING JIG FOR DIVIDING HEAD.

A New Line

In addition to this service, the firm spoken of are now handling two new lines of annular ball bearings. These new types are known respectively as the Schatz Universal, and the Schatz Commercial.

The former bearing has as its feature a three-area contact, which absolutely ensures against any binding strain. This type of bearing is supplied in light, medium and heavy series, and in millimeter sizes.

The second style handled is that of the commercial design. Two types, A and B, are made, the style A not being ground, while the type B is ground in the bore, outside diameter, and ball tracks. These two commercial types are supplied in English sizes only.

Each type has its own particular use, and to those interested we can only add that catalogues can be secured by request, which illustrate these lines fully, going into the mechanical details.

Taken in its entirety, this announcement of new appointment, new lines, and added service is one that should interest every manufacturer contemplating the use of ball bearing equipment.

The Generating Process of Producing Gears*

It is Questionable if the Average Mechanic Understands Thoroughly the Fellows Principle of Gear Cutting. This Article Covers the Subject in an Able Manner, Discussing Different Styles of Work Accomplished

ALL surfaces produced mechanically are either formed or generated. The simplest generating operating operation is that of a planer, which produces a plane or flat surface by means of the point of the planing tool. Another simple generating operation is the production of a cylinder by traversing the

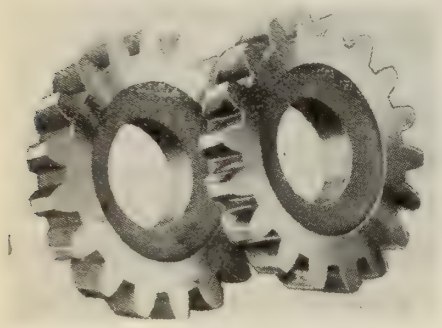

FIG. 1 -TWO CUTTERS AS DESCRIBED IN TEXT.

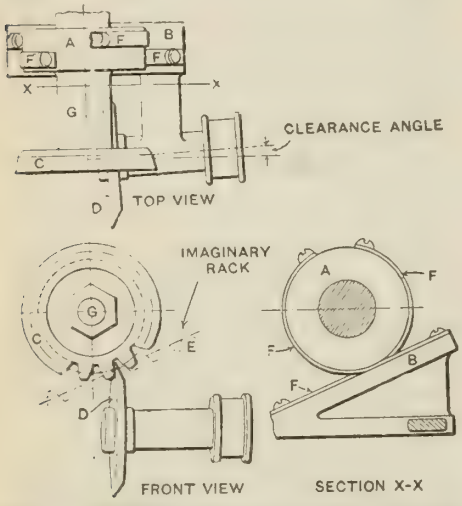
point of a lathe tool in a straight line while the surface being produced is rotated on its axis.

The simplest forming operation is the production of a plane or flat surface by using a broad milling cutter. It is obvious that any errors in either the form or the setting of a formed milling cutter will result in similar errors in the surface produced.

The generating process of producing a true surface of any definite kind offers fewer chances for error than the forming process. In gear cutting both the forming and generating processes are used.



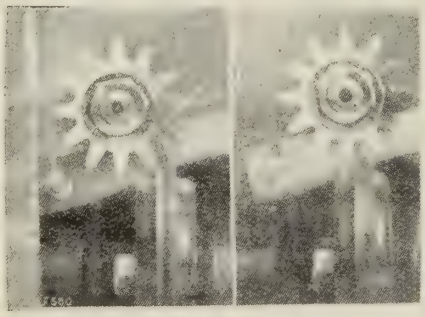


FIG. 2.—SHOWING THE PRINCIPLE OF THE CUTTER GRINDERS.

Since the cutters used in cutting gears can only reproduce in the finished work their own accuracy, it may be of interest to note how the cutters for each process are made.

The shape of the formed milling cutter is dependent upon the methods employed in making the template. These are generally hand and eye methods, requiring superlative skill even to approach accuracy. Then again errors due to hardening cannot be avoided, no matter how carefully that operation is performed. In the end the formed milling cutter when ready for use must naturally be inaccurate.

On the other hand the cutter as used on the Fellows gear shaper is itself a generated gear. It is first roughed out and then hardened. In Fig. 1 the left hand cutter has been hardened, but the tooth outlines are only roughed out while the right hand cutter has been finished. The involute tooth outlines are generated on the cutter by grinding after hardening. Thus any errors can be rectified, producing a very accurate cutter.

FIGS. 3 AND 4.—SHOWING EITHER GRINDING IN ROLLING CONTACT WITH WHEEL.

In grinding the tooth outlines advantage is taken of the fact that the flanks of an involute rack tooth are straight. As every gear will mesh correctly with a rack of the same pitch, it follows that every gear that meshes with its rack correctly will run correctly with each other. It is therefore possible to replace one of the flat faces of the imaginary rack with the flat face of the grinding wheel (D). This, in conjunction with the rolling motion of the blank, will cause the wheel to grind a true involute curve on the face of the teeth.

The principle of the cutter grinder is shown in Fig. 2. The grinder (A) is of the same diameter as the pitch of the cutter, and rolls on the plane surface (B). It is constrained to roll on that surface without slipping by the action of tapes (F), which control this rolling motion. The cutter (C) is mounted on the end of the spindle (G), which is solid with cylinder (A). As the cylinder is rolled up and down the plane the cutter, by means of the tapes on the cylinder, is caused to roll in exactly the same way as

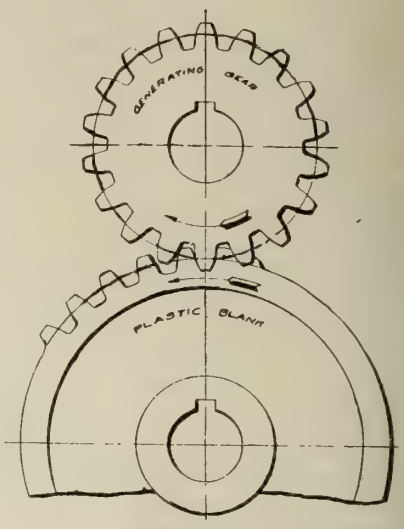

FIG. 5.

a gear in mesh with an imaginary rack (E) shown by dotted line.

Fig. 3 shows the cutter just rolling into contact with the wheel. At Fig. 4 it is nearly at the end of its rolling motion ready to return. By means of special instruments the gear shaper cutter is measured for tooth thickness and tooth space at the pitch line of every tooth and space on every cutter made. The measurements are indicated by a 10 to 1 multiplying lever bearing on the contact point of a dial micrometer gauge, which gives readings directly to .0001 of an inch; the error from one tooth to another must be well within .0004 before it is passed.

The principle of operation of the Fellows gear shaper is similar to the action of two gears in mesh; one gear, the cutter, is provided with teeth, which are relieved to facilitate cutting and to provide for sharpening without change of

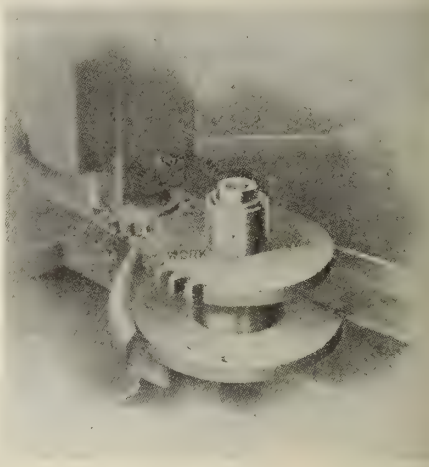

FIG. 6.

*From "Machine Tool Review."

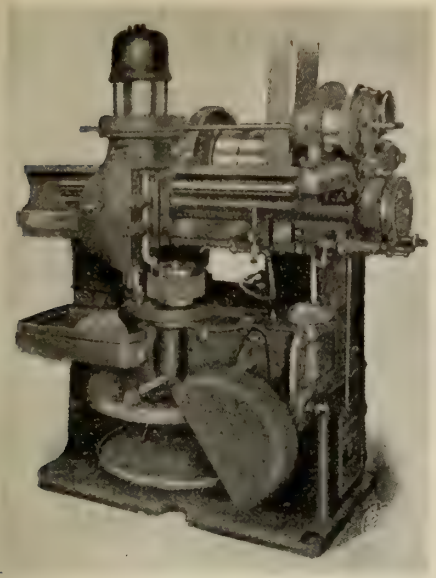

FIG. 7.

form, and the other is the gear blank to be cut.

Fig. 5 shows a metal gear rolling with a blank made of some plastic material, such as wax. When rolled together, as if they were a pair of gears in mesh, the generating gear will mould teeth on the plastic blank of proper shape to engage it. If the teeth of the metal gear are properly designed they will generate correct tooth outlines for a 12-tooth blank, for rack or for any number of teeth upwards, all of which will run properly with the generating gear or with each other.

Fig. 6 shows the scheme applied to the cutting of metal gears. The generating gear is made of hardened steel sharpened to a cutting edge all round its profile. The cutter is held on the cutter spindle mounted in the ram, and is given a reciprocating motion similar to that of a crank shaper.

At the same time the work and cutter are connected by gearing so that they slowly rotate together. The work blanks are mounted on an arbor held in the table or apron of the machine which is fitted with a relieving arrangement for withdrawing the work from the cutter at the return stroke of the latter.

Fig. 7 shows an illustration of the No. 6 Fellows gear shaper. The apron on which the work is mounted can be swung clear of the machine in order to facilitate

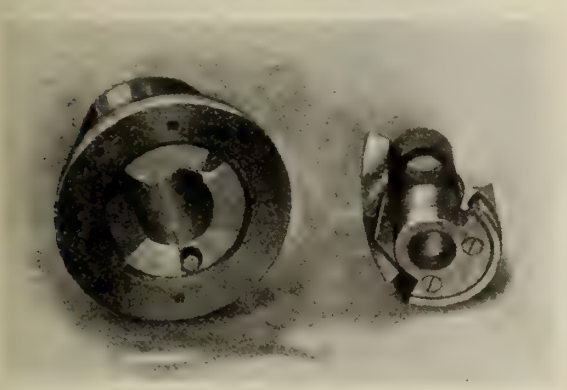

FIG. 10.

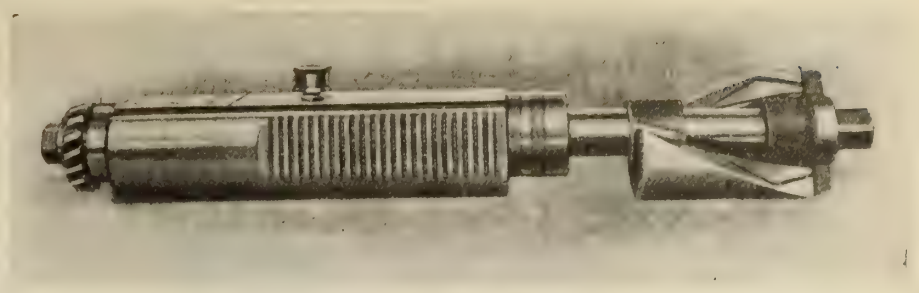

FIG. 9.

setting up. Two independent motions are provided for the feed of the cutter, the depth feed by which the saddle carrying the cutter is fed into the blank, and the rotary feed by which the cutter and blank are slowly rotated in unison. The rotary feed of the cutter is effected through change gears to preserve the correct relation between the number of teeth in the cutter and the number of teeth in the gear to be cut. A special chart gives the correct change of wheels to use.

In commencing to cut a gear it is usual to engage the depth feed first, the cutter being allowed to feed in three-quarters of the depth before the rotary feed is engaged. When specially accurate gears are being produced in large quantities it is more economical to use one or more gear shapers for roughing and another battery for finishing. In this way the cutter is not called upon to take roughing and finishing cuts, and so the finishing cutter which takes only a light cut will last much longer and produce better work.

Helical Gears

Spur gears with helical teeth are gradually superseding straight tooth gears where quietness of action is important. The reason for this is that in helical gears the tooth contact is progressive. It is made first at one end of a pair of teeth, then a little further from the end, and so on progressively until the end of the tooth is reached. By this time another pair of teeth will be in contact at the front end.

The Fellows Company have designed a machine for cutting the teeth of helical

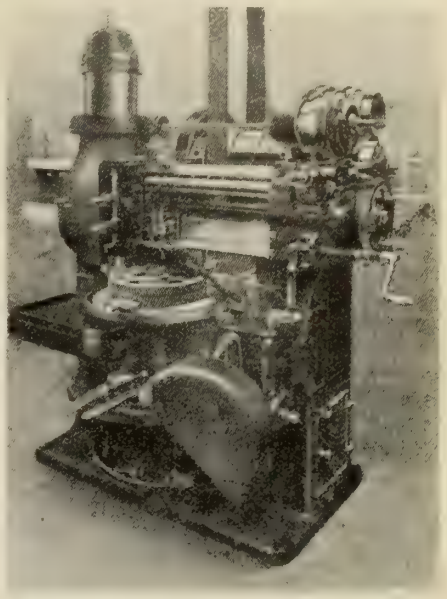

FIG. 12.

spur gears, both internal and external. It is similar in principle to the straight spur machine, with the exception that the cutter and cutter slide are given a spiral motion to correspond to the helix angle of the cutter. The substitution of

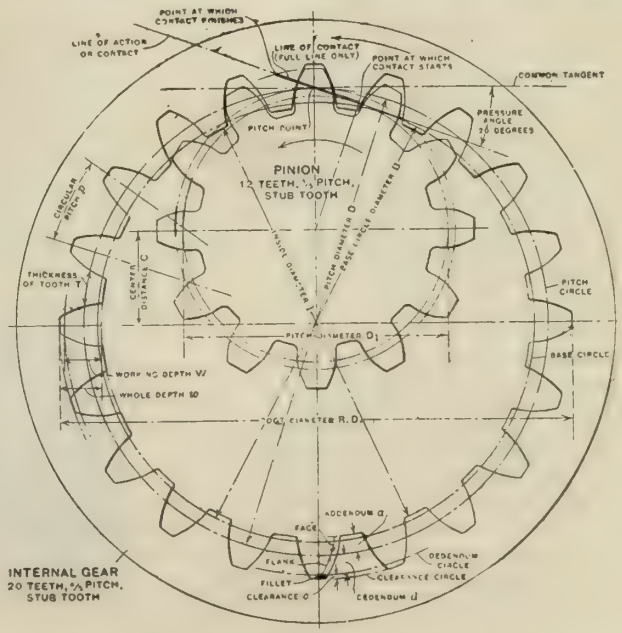

FIG. 13.

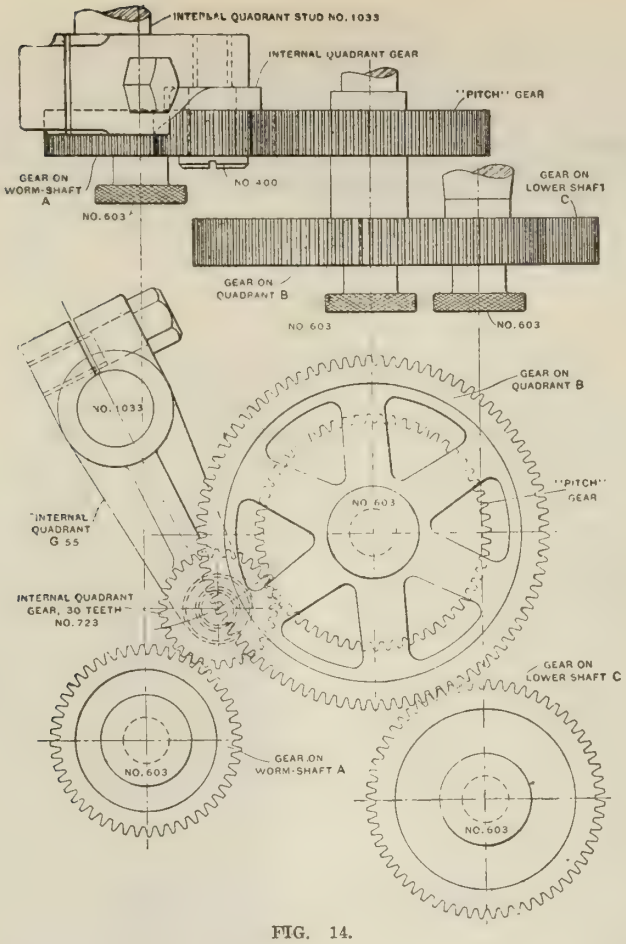

FIG. 14.

a helical in place of the straight guide to the cutter spindle, as shown in Fig. 9, produces this motion.

The guide shown in Fig. 10 is a block of cast iron, and is generated by means of special machinery to exactly the same angle as the lead angle of the gears to be cut. The mating guide, also shown in Fig. 10, is fixed in a large hub, which forms part of the upper index wheel. The guide in the hub is split and provided with endwise adjustment to take up any wear.

By means of the special machinery used any number of guides can be generated, enabling gears of exact interchangeability to be produced in large quantities.

The guides are quickly changed; ten to fifteen minutes only being necessary to change from one helix angle to another or from left to right hand gears.

Fig. 12 shows a helical machine cutting the driving gear of a British electric truck.

Internal Gears.

The cutting of an internal gear prior to the advent of the Fellows machine, presented a difficult proposition and was, as a rule, accomplished by make-shift means. The cutting of an internal gear on the Fellows gear shaper does not differ materially from that of cutting an external gear, the only difference being that an intermediate gear must be inserted in the train of change gears so as to keep the cutter and work rotating as two gears in mesh.

It will be realized that when cutting external gears the work and cutter rotate in opposite direction to each other, whereas on internal gears the work and cutter must rotate in the same direction. Fig. 13 illustrates this. An intermediate gear is therefore put between the gear on the worm shaft and the pitch gear (see Fig. 14). Otherwise the selecting and setting of the change gears is accomplished in the same manner as for external gears.

In cutting internal gears it is necessary to provide a groove at least 3-32 in. wide for the cutter to run into at the end of its stroke. This is to provide for the excess stroke of the cutter and for chip room.

Compactness of design and efficient tooth action represent two of the most important advantages that the internal gear possesses over the external gear. These two advantages make the internal gear particularly applicable to speed-reducing mechanisms. Within the past few years the internal gear drive has been applied with success to trucks and other heavy commercial vehicles, tractors, etc. This form of drive is highly efficient, and forms a very convenient and satisfactory means of transmitting power. Fig. 15 shows a phantom view of a popular type of internal gear drive axle as applied to trucks.

Internal gears give a highly efficient result when applied to reduction mechanism. An example of this type of gear is shown in Fig. 16, which illustrates what is known as the Turbo reduction gear. These reduction gears are made in various capacities, and are capable of transmitting power under different conditions. The particular ratio shown is for a 500 h.p. Turbo gear turbine drive, having a reduction of 7 to 1. The internal gear, as shown in Fig. 17, is applied to a disc clutch. The external member of this clutch is an internal gear, and sliding in this is a series of discs. These discs are kept in contact by means of a stiff spring, and as their faces are provided with a form of brake lining a very satisfactory drive is secured. As soon as the tension of the spring is overcome the discs are separated and the clutch disengages. When used in this connection the internal gear is simply used as a multiple spline. This is clearly illustrated in Fig. 18 where a detail view is shown of the internal gear member of a disc clutch.

Irregular Shapes.

At first sight the production of irregular shapes, such as gas engine and

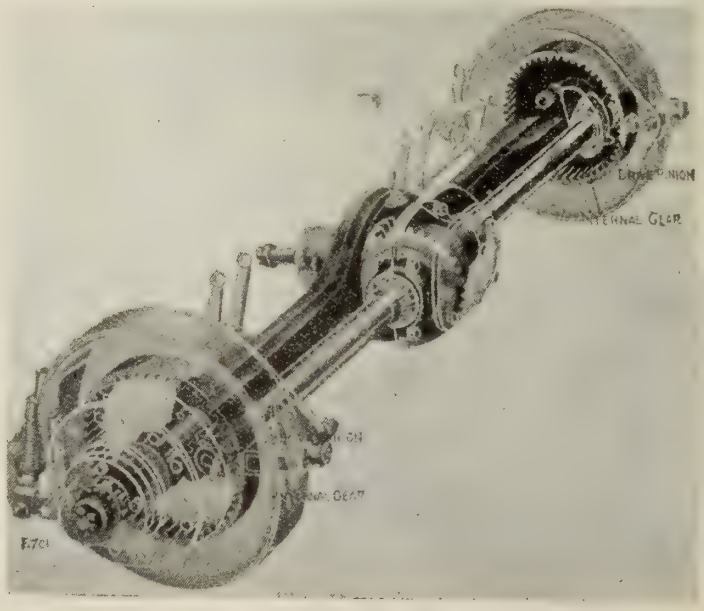

FIG. 15.

other cams, would appear to be beyond the scope of the Fellows gear shaper.

As a matter of fact, however, the machine will produce a more accurate cam than can be obtained by any other known method. The cutters have to be specially made to the required shape depending upon the cam.

The foregoing description of the gear shaper and the character of the work it is adapted to handle will illustrate the almost universal application of this machine. New uses are being found for the gear shaper every day, and for the information of the designer and manufacturer a list of some of the work the gear shaper is now handling on a commercial basis is appended.

Spur Gears, external and internal, within the capacity of the machine. External, pitch dia. 35 in., face width 51 in., pitch 4 D.P. Internal, pitch dia. 26 in., face width 3 in., pitch 4 D.P. Spur, cluster and shoulder gears.

Helical Gears, external and internal within the capacity of the machine. External, pitch dia. 26 in., face width 5 in., pitch 5/7 stub. Internal, pitch dia. 26 in., face width 3 in., pitch 5/7 stub. Helical, cluster, shoulder and double helical gears.

Herring-bone Gears. Chain sprockets. Ratchets, internal and external. Cams of all shapes both internal and external within the capacity of the machine. Geneva stop cams. Splined shafts and keys not exceeding 5 in. long. Graduating, and dividing.

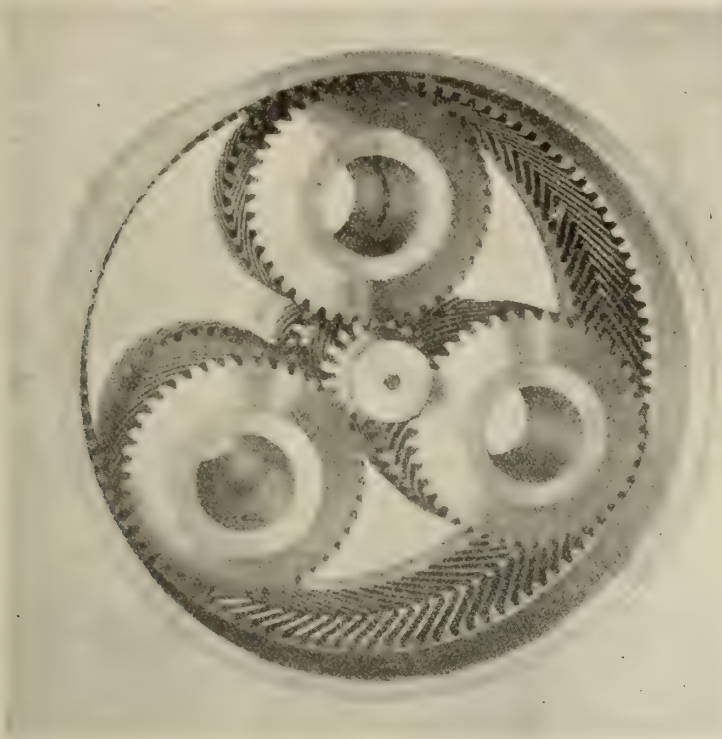

FIG. 16.

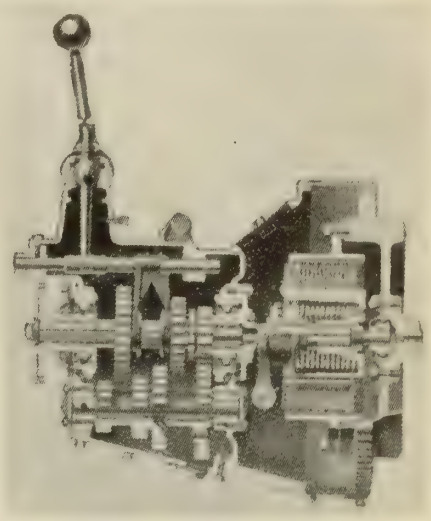

FIG. 17.

PYROPHORIC IGNITION

One of the minor changes brought about by the war is the increased use made of pyrophoric ignition devices, which are, after all, merely a modern form of the old flint and steel and tinder box. Where flint was used the sparks obtained were weak and uncertain and a good deal of practice was required before the tinder could be ignited with certainty. It was not long before it was found that various forms of pyrites, struck by steel, gave off sparks of greater heat and larger size, and had it not been for the discovery of the mineral cerite, there is no doubt that the use of pyrites would have been still further developed.

The spark-giving properties of cerite, when first discovered, seemed likely to prove of little commercial value, as there was a difficulty in producing the substance in sufficient quantities. A German scientist, Muthmann, gave a good deal of attention to the subject and devised, with the aid of his students, a method by which cerite could be produced by the aid of fusion and electrolysis. Another German, Auer, whose name is chiefly known in connection with the gas mantle, availed himself of the discoveries of his predecessor, but even he did not realize the commercial importance of the discovery. He took out a patent covering the use of alloys of cerite with heavier metals, and this had the effect of checking the investigation of others in the mineral and its properties. An Austrian, in Vienna, disregarded the Auer patent, and having become possessed in some way of a specimen of the Auer alloy, devised a pocket kindling apparatus, in cartridge form, in which a piece of steel, suitably notched, was made to rub against a piece of cerite alloy, by pressure, and give off sparks which were caught on a piece of charred rag which could be used for lighting pipes or cigarettes. Hearing of this, Auer took steps to safeguard and develop his discovery and ultimately sold his German patent to a Cologne company, who paid a sum equivalent to £30,000. The Austrian inventor also began the development of his cartridge lighter in a commercial form, and there was subsequently a keen competition between the German and Austrian houses, and the ultimate outcome was an attack on the validity of the Auer patents. At that date it was known that Auer had made several errors in connection with his gas mantle patents, and whether this influenced the decision or not, the Patent Office annulled the second Auer patent. Auer had stated that the pure metal, cerite, did not possess pyrophoric properties and although he subsequently altered his opinion on the matter, it was decided that his patent only related to alloys which contained 30 per cent. and over of heavy metals. According to Dr. Bohm, another German scientist, the use of light metals as alloys suitable for use with cerite was not mentioned in the Auer patents, although a manufacturing firm, Kunheim & Co., had specified these. As a result of several objections their patent was also annulled, and as a result there is to-day no monopoly in pyrophoric materials. According to him there is a third possibility of producing pyrophoric substances, illustrated in the so-called Lucium patent. The efforts of Krieger to produce pyrophoric alloys containing no cerite have so far only led to the discovery and use of materials which only give out satisfactory sparks under certain restricted conditions.

ERRATUM

A regrettable typographical error occurred in the Dec. 4th issue of CANADIAN MACHINERY in connection with the leading article on the Greaves-Etchells electric furnace. On page 547, third column, the statement is made that "During this time 220 heats were run off. This statement is erroneous, and should read: "During this time 2,200 heats were run off."

The Use of Vee Blocks in the Machine Shop*

While Vee Blocks Are Used in Many Ways in the Machine Tool Industry, it is an Open Question if Their Value as an Accurate Means of Lining Up Work is Appreciated and Understood.

By JOSEPH HORNER

GENERALLY all cylindrical articles that are not held in special fixtures are attached to machine tables while supported in vee-blocks. They are seldom put in semi-circular seatings, because these will only take one exact diameter, while a vee will accommodate diameters that vary by from half-inch to an inch, dependent on the depth of the vees. These sustain the cylindrical articles centrally, they prevent them from rolling about, and they also maintain them at a uniform height from the table. The vees provide the support; the clamping is done in various ways, differing with circumstances. The cylindrical pieces held are mostly shafts and spindles that have key-grooves cut in them or facets tooled. But a considerable volume of work of a different character is held for tooling of other kinds, for which the shaft located in the vees is not the part operated on, but an intermediary, to carry the work to be planed, milled, etc. Brackets and articles of many kinds

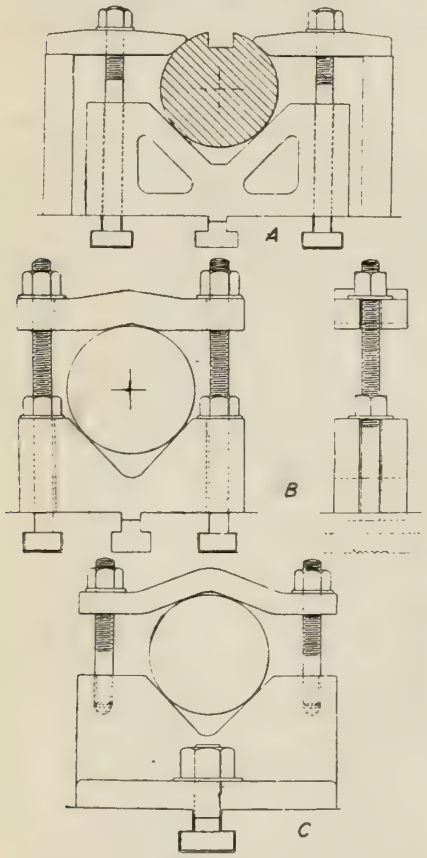

FIG. 1.

that have bored bosses have shafts thrust through their bored holes, and the shafts are laid in the vees and, being clamped down and the bracket also being suitably secured, its foot or the other portion to be faced is dealt with. The advantage gained is that the machined face occupies its correct relation to the bored hole, and it is more likely to be accurate than if it were faced first and the hole bored subsequently.

These very essential blocks occur in a good many varieties. The plainest kinds are represented by the typical form in Fig. 1, A. The block is made in forged iron or steel in the smallest sizes, in cast iron in the larger, and lightened out as shown in the largest. It is simply laid upon the table, in many cases without any tongue to guide it in the tee-groove. The work is very commonly clamped in the manner shown, but only necessarily so when a key groove or a facet has to be tooled along the whole length of the shaft, to permit of which the clamping plates must be kept clear of the tool. The abutting ends of the clamps are made convex, and if the shaft is polished it is well to insert a bit of packing, of card or soft metal sheet, to prevent it from becoming marked by the clamps. These clamps and their packings are those used for general service on machine tables. The bolts that secure the clamps also hold the vee-blocks down.

When the tooling to be done is not continuous, but only occurs along a portion of the lengths as, say, near the ends, the clamp plates may be bridged right across. (Fig. 1, B.) In this instance the clamps are portions of the vee-block, which economizes time spent in fixing up. There is the further greater advantage that the bolts can be brought very close to the work, instead of standing a considerable distance away from it, as at A. The grip will be better. The bolts are a permanent fitting in the vee-block. The lower nut holds the block down on the table, the upper nut tightens the clamp plate on the work. The bolts are slid into place endwise in the block through open slot holes with clearance. The alignment of the blocks is secured by a shallow tongue on the base that fits the tee-grove. A slight self-centring of the clamp plate is provided for by cutting a shallow vee of large angle to fit on the work.

Fig. 1, C, shows another design, in which the block has a tongue fitting in the tee-slot. The bolts are permanent fittings, being stud bolts in this instance. A separate clamping bolt is therefore necessary to hold the block down It goes through the flange seen. The clamp plate is a slightly better form than that shown at B, because, being cranked downwards, it affords a larger area to grip the work, and the bolt length is correspondingly lessened, giving a steadier grip.

There are several designs of vee-blocks which are used to accommodate different diameters on a single piece of work. This is very often done by selecting a couple of blocks that stand at different heights. But the difficulty often then is to get the precise differences in heights required, which renders the use of thin packings necessary. There are of angular section laid in the vees, or they are plain packings under the foot. These adjustments are avoided by employing

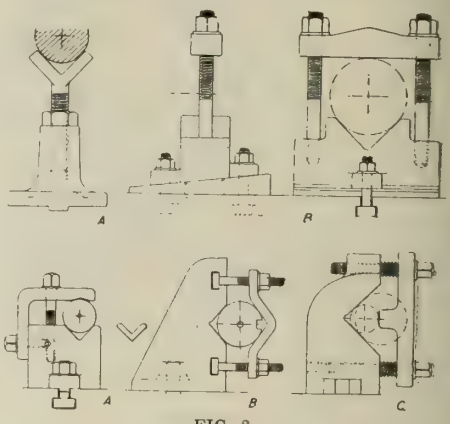

FIG. 2.

vee-blocks of either of the shapes shown in Fig. 2.

At A the vee has a screwed stem entering a boss with a tongued base. The screw has a locking nut. The height adjustment required is obtained by rotating the vee, setting its height by measurement and locking its screw with the nut, after which the work is laid in and clamped by the method most suitable for the job. In the example shown, as in all tall blocks, the height is unfavorable to stability, but this is unavoidable in many cases. A common illustration of this kind is that of a dip crank, where the shaft must be raised high enough to permit the crank to clear the machine table. At B another design is shown, which is rather better than at A. Here the vee-block is made separately from its base, fitting to it with an inclined plane, which affords a fair range of height adjustment. In this feature it resembles a good many adjustable packing blocks. The stud bolts in B fit into the vee-block and the clamp plate is a permanent fitting. It is stiffer than those previously shown, being thickened where the bending stresses consequent on the tightening of the bolts come.

The group in Fig. 3 shows blocks suitable for holding articles that have to be milled with a horizontal cutter. In A the block is bolted to the table through a tee groove, to which it fits by a

*From "Hardware Trade Journal."

tongue. The clamp plate, of right-angular shape, is attached permanently to the block. It is adjustable in the vertical direction to accommodate varying diameters through a slotted hole moving over the set-screw that is tapped into the

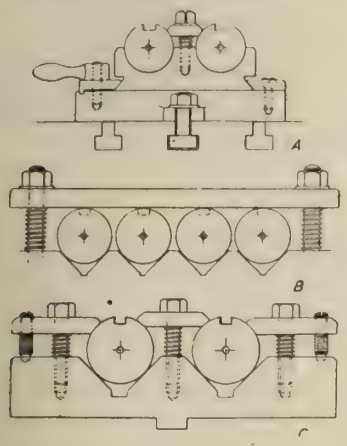

FIG. 3.

block. A set-screw above grips the piece of work through the clamp, which is veed to embrace it. Packings can be inserted, one of which is seen to the right.

The objection to this form is that, although it admits a fair range in diameters, each different diameter stands at a height which varies with diameter. If the centre for one coincides with the horizontal axis of a cutter the centres for all other sizes will not, but will stand higher, or lower, with increase or lessening of size. This in the case of a machine where the cutter cannot be adjusted for height renders the form objectionable. A better design therefore is that at B, where the vee is cut in a vertical face, so that all diameters will lie in the same horizontal axis. The clamp plates, if fitting permanently as shown, would interfere with the cutting of a groove along the entire length, but not with tooling in lesser lengths. If a whole-length cut must be taken plates and packings like those in Fig. 1, A, can be substitnted.

A variation in this form is shown by Fig. 3, C. The principal difference lies in the larger range of capacity provided in C. The vee is very deep, so that it will centre a small shaft like that shown, or one much larger, indicated by the dotted circle. The clamp plate is designed to accommodate this range, having a projection on one side for small shafts and being left flat on the other for large sizes. Another detail of value is the fitting of coiled springs to throw the clamp off the work on the release of the nuts.

In all the previous examples only a single article is gripped at one time, which is not economical when quantities are called for. For these requirements special blocks are made, which may be grouped with the fixtures. In Fig. 4, at A, a block is shown which carries two shafts lying in semi-circular recesses with means for rapid gripping. The block is made in two portions with a base bolted to the machine table, through a bolt in a lug at each end with open slot holes and the work-holding block, which lies on this and is held between bevelled edges, one of which is screwed fast by the strip to the right, while the other, to the left, is tightened with a lever nut. This strip has an abundant tongue fitting in a groove. Its face stands off the base, so that the tightening of the nut causes the bevelled edge to take a grip on the block. The latter will only receive shafts of one exact size, so that it is only suitable for repetitive work. Two shafts are shown, held with central clamp plates with set screws and spring to throw them off when the nuts are loosened.

The vee-block shown in Fig. 4, B, has provision for holding four shafts to be tooled only over portions of their length, since one clamp plate covers the whole series. Springs throw the plate off. The block at C has separate clamp plates, to permit the cutting along the whole lengths of the shafts. The flanking clamps are tightened finally after having been set horizontally by the grub screws. Springs throw the plates off the work.

There is no particular advantage possessed by the form at A, so far as the semi-circular recesses are concerned, over the vees in B and C. Possibly some may think the support would be steadier

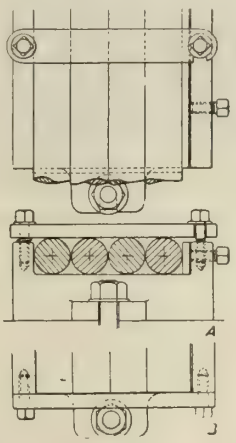

FIG. 4.

than that afforded by vees, but the claim could hardly be insisted on. The real advantage lies in the method of gripping the block, since it permits of the use of duplicate blocks, one of which can be loading on a bench or machine table while the tooling is proceeding on the other. The machine is thus kept fully occupied, instead of being held up during loading.

In Fig. 5 a method is shown of holding several shafts without inserting them in vees. From the plan and end view, A, it will be seen that the shafts are disposed side by side in a recess in the block, and are tightened laterally with set screws, pressing a loose strip against one of the outer shafts so pushing them all against the resistance offered by the abutment on the side opposite. A single hinged clamp plate bridges and secures them all. The plate, or plates if the block is long, are hinged on one bolt, to be swung aside, instead of lifted off, and the pivot bolt has a coiled spring. The clamp prevents cutting along the whole length of a shaft. An alternative then is to clamp laterally, as at A, but to exercise end pressure also, as at B.

A WRINKLE IN BRASS CASTING

In casting brass and some of the bronzes on the flat there is often a very great tendency for the castings to become "smoky,"as it is termed, this, in reality, being caused by a series of cold sheets in more or less developed stages. Assuming that the metal poured is clean and in a good fluid state, this points to the fact that too slow pouring has been used and waves of air have passed in with the metal, the remedy being obvious. As an additional precaution, however, it is well to adopt an uphill method of pouring, as shown in the illustration, the flasks being placed at an angle of roughly 20 deg. from the horizontal, with the ingate to the mould at the lower end. By this method the ingate is kept choked with molten metal, with the result that air cannot pass, and in combination with fast pouring, smooth castings should be produced. In most cases it will be found necessary to put in risers on projections as shown, so that not only shall air and gases escape freely, but also that any dirt carried to the higher points and there trapped may rise out of the way in the readiest manner.

This article was taken from "The Practical Engineer," and we will not attempt to throw a hint about where they got it, but by a strange coincidence we had it in CANADIAN MACHINERY in the issue of old 1918. Of course, there is nothing particularly new about the idea, but it is not generally followed, although it is the proper way to get a sound casting, either in brass or iron.

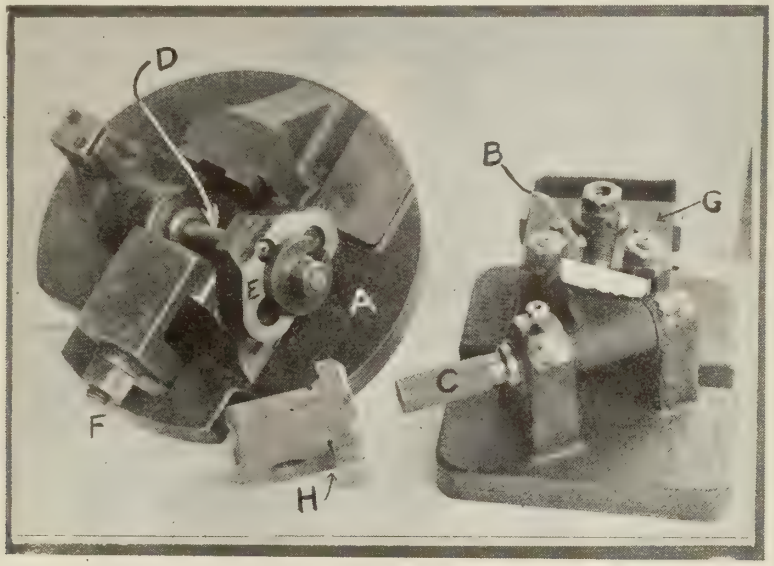
For an iron casting of this description, it would be best to cover the risor until the pouring was done, but with brass the risor should be left open for the escape of air.

GETTING OVER THE THUMB TACK TROUBLE

By Harrison Jenkins

It often happens that the usual system of placing your thumb tacks on the drawing-board becomes quite a nuisance, but if readers interested will employ the scheme shown in the accompanying illustration this difficulty may be easily overcome.

Of course such an idea as this is only applicable where standard size drawings are made.



Merely counterbore a slight distance down in the drawing board, small holes. Bore these holes where the tacks come on these standard sheets, which naturally will be just clear of the trimming line. In this way you will have no further difficulty with raised tacks hitting your T-square, and even should the holding holes for tacks get pretty well used up in time you can easily insert wooden plugs or cork inserts, so that this fact should not deter readers from adopting the idea.

Two Interesting Fixtures Used on Automobiles

By J. H. MOORE

TWO very interesting fixtures are shown in the accompanying illustration. First, we will refer to the jig marked A. This is known as a turning fixture for the support spring bracket on the Overland car. The operation consists of turning, facing and threading the portion marked B. While looking at B, let us closely consider the peculiar form of this spring bracket. It is easy to realize that this is a difficult piece to hold in proper position, so in order to ensure rapid handling, the first operation consists in drilling and reaming the hole through which the pin C is placed in the photograph.

This hole being drilled and the bosses faced, makes the task a simpler one. The bracket is placed over the stud D and held in position by the clamp E. The complete fixture is bored and threaded at the back to suit the spindle of the lathe. The clamp F is also utilized in the holding of the work. Thus a difficult piece to handle is so arranged on a fool-proof jig to ensure both speed and accuracy.

TWO INTERESTING FIXTURES, BOTH OF WHICH HAVE PROVED VERY EFFICIENT.

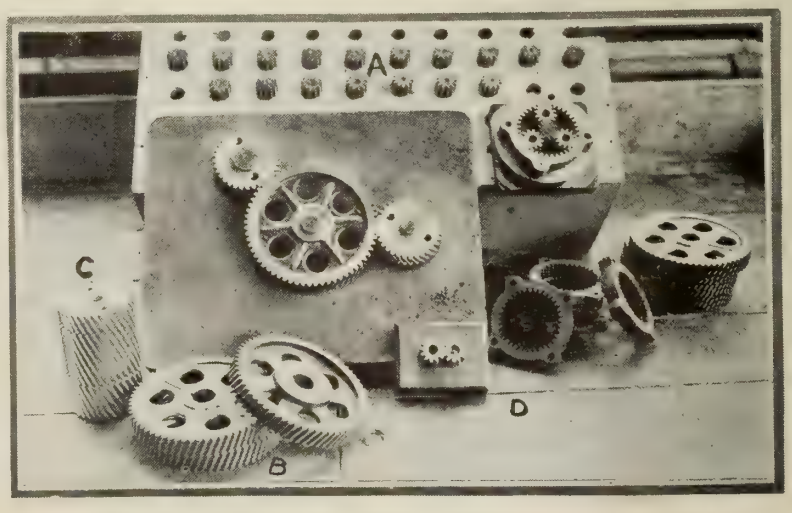
The other fixture illustrated is used on a bevel milling operation on the same piece. It is necessary to mill a 45-degree bevel on this part, which must be absolutely accurate, owing to the fact that all the strain is taken on this face, also that this piece fits into the rear axle housing. Even a slight variation would mean that undue strain would come on the portion B, with possibilities of damage resulting, so that this operation is conceded to be a very important one. The pin C goes through the hole already described, while the portion G is slid in until it comes to a definite stop. The bracket rests on this slide, after which it is clamped securely in position.

To test the accuracy of work turned out on this milling jig, the gauge H is used. Workers are held to very close limits, being allowed plus one thousandth, with no minimum whatever. The nature of the gauge is such that the work can be passed on very rapidly. Placing the portion B through the hole in the gauge H, the lugs J and K at once determine the accuracy of the product turned out. Readers will, no doubt, be surprised to learn that such close limits are the rule rather than the exception in automobile manufacture.

Gear Gauges of Special Interest

By J. H. M.

THE testing or gauging of gear teeth is at any time a very interesting study, so that we feel sure our readers will be interested in the following description of various test gauges used at the plant of the Willys-Overland Ltd., of West Toronto.



Perhaps, as good a plan as any would be to point out the technical names of the various gears shown in the illustration. The small gears shown on board at A are known as the steering shaft pinions, while the cam shaft gears are shown at B. The generator gears for crank shaft are shown at C, and the steering pinions at D.

The first gauge which we will consider is the one shown at D. Two differential steering pinions are placed on special studs on this gauge, and the pinions revolved to ascertain their smooth running.

The second gauge used is shown at E, and is used to test the timing gears. In this case, three gears mesh into each other, being placed on studs as before.

The last gauge illustrated is arranged to test the steering pinions, the three differential pinions, and the internal gear. The same principle holds good in this case also, the complete arrangement being mounted on a plate as shown.

This method of testing the accuracy of gear teeth has proved very successful, and ensures that nothing but the best of work passes the inspectors' hands. The majority of the gears cut at this plant are cut on gear shapers, which further aid in the high quality of the product turned out.

A GROUP OF GEARS WITH THEIR ACCOMPANYING TEST BLOCKS.

WELDING AND CUTTING

HINTS TO WELDERS

To readers not familiar with A. W. P. products, we might say that these electrodes, outfits, etc., for electric arc welding are manufactured by the Alloy Welding Process, Ltd., 14-16 Cockspur St., S.W.1, London, England.

The "A.W.P." electrode has only recently been placed on the market, but it has been used privately for some years, and has proved its value by reason of the excellent results obtained. In changing over from another type the operator will probably not feel "at home" with the first two or three electrodes used. He would, therefore, be wise not to condemn the electrode after one trial run, but pass judgment after he has welded with "A.W.P." electrodes for some little time.

Our electrodes are just as good on alternating as on direct current. The operator will, of course, be controlled by existing conditions as to plant, but if on D.C. from a separate generator adjust the voltage by the shunt regulator to as near 60 volts as possible. This lower voltage may make welding a little more difficult for the first two or three hours, but it will soon be noticed that there is a considerable improvement in the weld. With this low voltage it is necessary to keep a shorter arc, and that means better welding.

If welding with A.C., do not use a non-inductive grid resistance in your circuit to adjust the current. Try and get an adjustable choking coil, which provides the same variation in current in addition to steadying the arc and saving power.

Be guided more by personal judgment as to the current than by any set table; a higher current means quicker welding and a better weld.

The temperature of the electric arc is constant, and is not affected by the amount of current passing whilst temperature of the work depends on the length of time the arc is played on the work. The current only affects the quantity of heat generated in a given time, so if welding is carried on faster with a higher current the work will not get any hotter with a lower current for a longer time.

Use, therefore, as high a current as can easily be manipulated without burning through the metal.

When on work which comes under the regulations of any classification society (shipbuilding) you must be guided by their rules as to preparing plates, etc. On other work vee all close butt joints, and where welding can only be done from one side the vee should extend to the bottom of the plate. When welds are to be made on both sides of the plating the veeing need not be carried right through if the edges are left slightly open.

On plates of ½ inch or less, excellent butt joints can be made without veeing by leaving the plates 3-16 inch to ¼ inch apart, and making a light run down the back, or by using a light butt strap at the back if welding from one side only.

Except when working under society or local regulations, it will be found that with our electrodes there is no need to chip off the slag when making a second run of metal. Just brush away the loose pellets with a brush and chip a clean place to start upon. The slag will then flow well away from the fresh metal and come up to the surface.

In using the "A.W.P." electrode do not worry about the slag, which will be found to run so freely that it sometimes comes back behind the electrode. Moreover, the slag keeps running away from the metal, thus preventing the formation of slag-holes in the weld.

A NEW WRINKLE IN CARBIDE ECONOMY

By E. D. Bullard*

It is well known that calcium carbide will waste considerably when exposed to the air for an extended length of time. This slacking will vary, of course, with the duration of the exposure and the amount of moisture in the air. In some industries where huge quantities of carbide are used this loss is noticeable, especially in remote regions where transportation cost must be added to the purchase price of the carbide.

This is particularly true in tropical operations, due in part to the high humidity, and in part to the low intelligence of workmen who cannot be made to understand the need for careful handling of their daily allotment of carbide. This very serious waste has led to some interesting experiments in the large mining operations conducted in the Island of Sumatra. These enterprises are operated on a very large scale and employ many thousands of native miners, and tremendous quantities of carbide are shipped to them constantly from the United States.

Some time ago the writer was informed that the wastage from air-slacking at the Sumatra mines has been practically eliminated by the simple expedient of anointing all carbide with kerosene oil; each drum is opened and filled up with kerosene, which is immediately thoroughly drained off and used in the next drum. In this way an astonishingly small quantity of oil is expended, and yet each lump of the carbide is coated with it and completely insulated from the atmospheric moisture. In this state the carbide will not slack at all unless brought into contact with water. It can be carried in sacks to distant points, by prospectors, for instance, or for the use of construction gangs with flarelights, etc. There is no loss from slacking unless the carrier gets caught in the rain, drops his load in a stream, or, in a word, allows water to reach the carbide. In such a case the carbide will become a total loss, of course.

The point is that atmospheric moisture affects the carbide thus treated not at all. In the lamp or generator, however, there is no loss of acetylene through the presence of the kerosene envelope. Indeed, there is, presumably, some added heat in the flame due to the kerosene vapor generated by the heat of slacking when the water reaches the carbide.

Of course there is the expense of the kerosene that adheres to the carbide, but this is said to be quite insignificant compared to the great saving in carbide.

This method has been very well tested out at the Sumatra mines and in generally adopted there. The atmosphere of that country is exceptionally humid and the loss of carbide in the old days was proportionately great. The writer has tried it out very thoroughly, also. He carefully cleaned and dusted two pounds of ⅜ inch (mine-lamp size) carbide, coated it well with kerosene, which took approximately one fluid ounce, and set it out spread thin to a day of hot sunshine and strong ocean wind, and a night of heavy San Francisco fog. There was no loss of weight and no slacking dust after this exposure. Not even the slightest odor of carbide could be detected when the pan was finally brought in from the window-sill; only the slight smell of the kerosene was present. The treated carbide was then subjected to a burning test along with untreated carbide in every type of mine lamp. It gave off gas freely and burned as long, or longer, than the untreated carbide, and gave a perfectly clear flame. On cleaning the lamps the sludge was in no way different from that of the untreated carbide.

*From Acetylene Journal.

WHAT OUR READERS THINK AND DO

EQUALIZING GEARS FOR BUCKET CONVEYORS

By John S. Watts

Any engineer who has operated a bucket conveyor driven by plain gears, knows from painful experience the heavy strain put on such mechanism by the uneven velocity of the conveyor. The reason for this unevenness is that the links of a bucket conveyor are relatively long between centres of pins, and therefore the driving sprockets, to be of a reasonable diameter, are generally made with only six teeth. This, with plain circular gears, gives the buckets a maximum velocity equal to $\pi \times D \times$ R.P.M., and a mean velocity of $3 \times D \times$ R.P.M., D being the diameter of the sprocket from centre to centre of link pins, or in a six-tooth sprocket, twice the length of the link centres.

This can be proved from a perusal of Fig. 1 by noting that the centres of the link pins in one revolution of the sprocket travel a distance equal to the circumference of a circle whose diameter is D; i.e., a distance of $\pi \times D$, while the actual travel of the bucket chain in the same time is only the length of six links, or $3 \times D$.

To overcome this effect, it is necessary to have the driving sprockets revolve at a speed which will vary the amount necessary to give a uniform velocity to the buckets. While this causes the driving sprockets to have an unequal speed, the mass of the sprockets is so small relatively to the mass of the buckets and chain that this uneven velocity is of no importance.

In all that follows, we assume that a six-tooth sprocket is being used, but no difficulty would be found in working out the problem for a sprocket with more or less teeth by using the same reasoning.

As the peripheral velocity of the sprocket must vary from the minimum to the maximum and back to the minimum six times per revolution, it is essential that the ratio of gear to pinion be some factor or multiple of six, and will generally be six. Now, this ratio of six is the mean ratio, and a pair of gears can be decided on which will transmit the required horsepower, using the usual formula and neglecting for the moment the equalizing effect required. The general dimensions of the pair of gears being decided, we have the distance centre to centre of gear and pinion, which distance we lay off as shown at C in Fig. 2; on this line describe a circle whose radius is $\frac{6 \times C}{7}$, which represents the mean pitch circle of the gear, which is the same as it would be if we intended using a plain circular gear.

From the above it follows that the maximum peripheral velocity of the sprocket should be $\frac{\pi}{3} = 1.0472$ times the mean velocity, and should occur six times per revolution. Now the mean gear ratio being six, the maximum gear ratio will be $6 \times 1.0472 = 6.2832$, and the short radius, a, of the pinion will be

$$a = \frac{C}{1 + 6.2832}$$

From centre line of pinion shaft lay off this length a, and from this new point measure back the radius of the pinion pitch circle as already decided and describe pinion pitch circle as in Fig. 2. Note that the pinion is truly circular but bored eccentric by an amount equal to $\frac{C}{7} - \frac{C}{7.2832}$; the centre of pinion shaft being exactly where it would be for a pair of plain circular gears.

Next lay off centres of teeth on the pitch circle of both pinion and gear, projecting the latter out to the circle drawn through the centre of the pinion shaft.

Now measure lengths from centre of pinion shaft to centres of teeth on pinion pitch circle, as at a, b, c, etc., Fig. 2, and lay off these distances inwardly from circle through centre of pinion shaft on lines projected through tooth centres on mean pitch circle of gears as shown. Through the points so found draw a curve which will be the required pitch line for the gear. In other words the pitch line of the gear is described by graphically rolling the pinion pitch circle around the gear.

Only one 60° segment has been worked out in Fig. 2, as the other segments are all duplicates of this one.

The teeth of the gear can be now laid out by the usual methods, using the curved line for the pitch line.

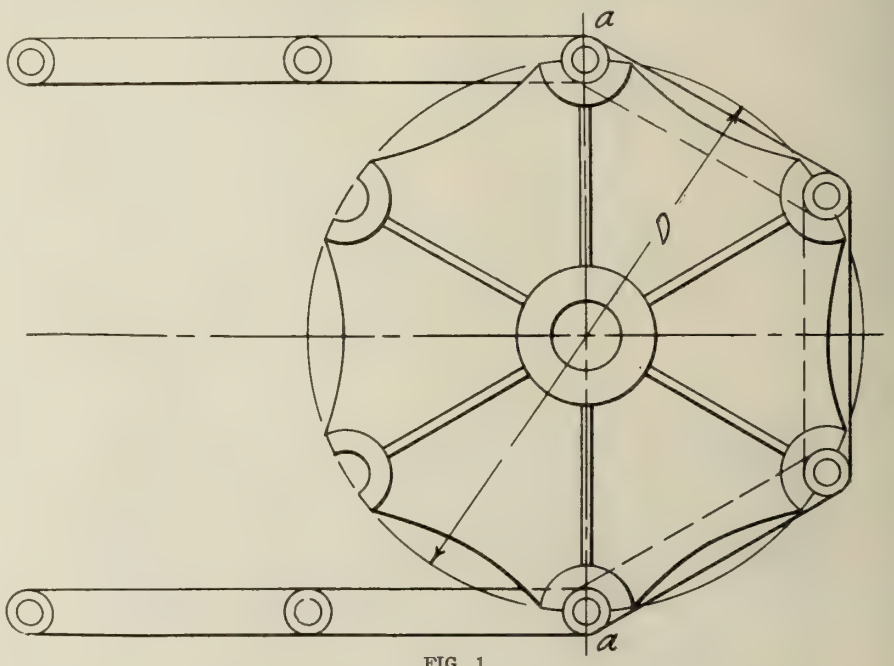


FIG. 1.

It will be found that where the gear ratio is half the number of teeth of the sprocket, the pinion pitch line will be elliptical in shape, as then one revolution of the pinion will take two points of maximum velocity and two points of minimum velocity.

In erecting these gears, care must be

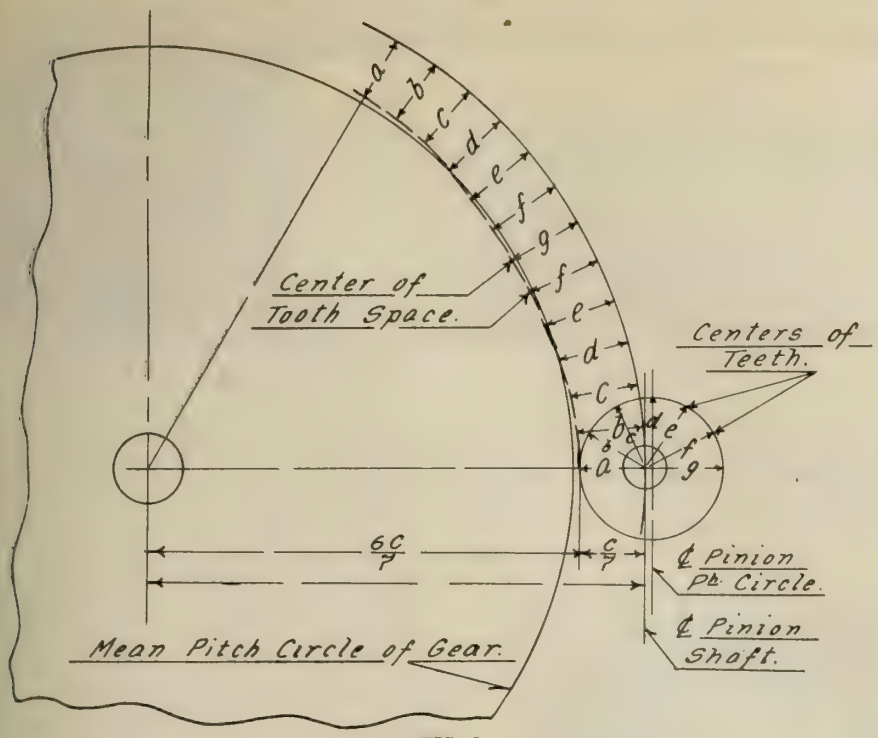

FIG. 2.

taken to get the gear and pinion set so that tooth "a" on pinion meshes with one of the teeth spaces marked "a" on the gear.

Also, in keyseating the gear and sprockets, the work must be done so that the centre lines through the points of maximum pitch diameter of the gear, i.e., at "a" in Fig. 2, are in the same plane as the centre lines through the sprocket teeth marked "a" in Fig. 1.

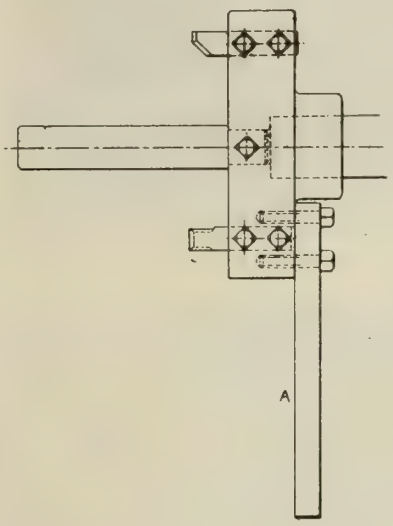
GRINDING CHUCK FOR GEARS

By J. H. Moore

A very interesting grinding chuck is shown in the accompanying sketch. This chuck is used at the plant of the Machine and Stamping Co. for the grinding of some of the gears on the differential for the Overland Four car.

As will be noted, the chuck really grips on the pitch line of the gear teeth in this way, ensuring absolute accuracy. The chuck is of the collet construction, pulling up in the regulation manner. When very accurate work is desirable one cannot do better than follow out the principle shown in the illustration.

After the gear is chucked in the method described, the centre hole is ground out on a regular style machine.

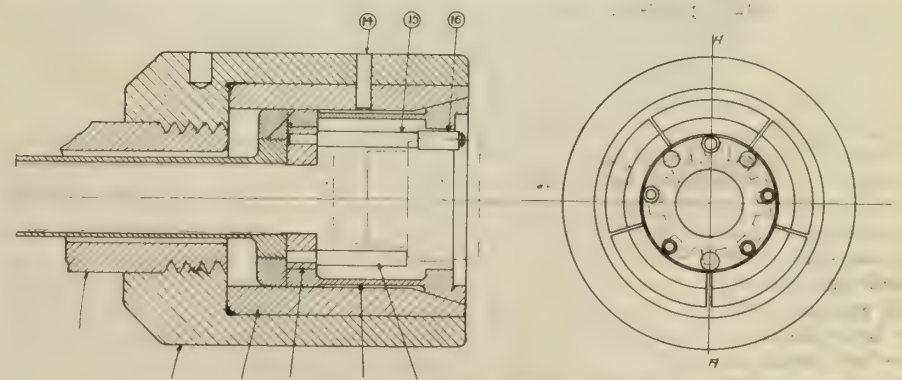


PERSONAL

E. L. Cousins, the energetic manager of the Toronto Harbor Commission, will leave Toronto at the end of January for a trip to England. He will, while over there, endeavor to secure new industries for the city, particularly for the sites which have been developed by the Harbor Commission.

Death occurred very suddenly to Mr. William Ross, general superintendent of the Phoenix Bridge and Iron Works, Montreal. He was stricken on Windsor street while on his way home, and died immediately. Death was due to heart disease. Mr. Ross was born in Ontario about seventy years ago. He held the position of general superintendent for the last twenty-three years. He is survived by a widow.

The death is announced from Montreal of David Robertson Stewart, deputy port warden of the port. Mr. Stewart was a native of Liverpool, England, and was 39 years of age. Until about 15 years ago he followed the sea, sailing in the Beaver, Elder Dempster and Canadian Pacific Lines. He then joined the shore staff of the C.P.O.S. and was appointed deputy port warden of Montreal in 1914. He was a member of the Waverley Lodge, A.F. & A.M., and of the St. Lawrence Curling Club. He is survived by his widow.



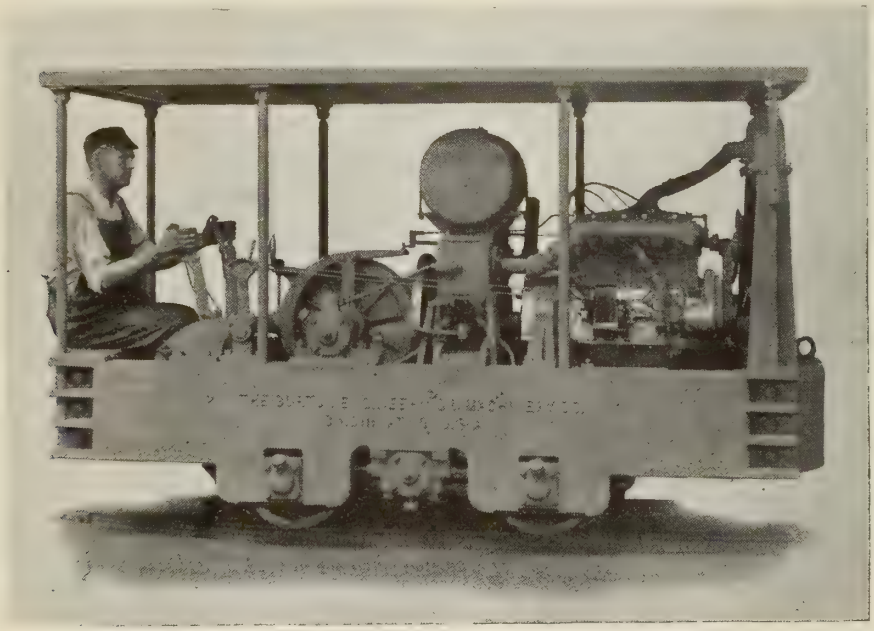
The Taylor Instrument Companies, Rochester, N.Y., have issued the 1919 edition of their General Industries Catalogue of Tycos instruments. This catalogue lists the temperature instruments manufactured for the requirements of manufacturing and industrial operations. Thermometers of all types, hydrometers, viscometers, pyrometers, both indicating and recording, temperature control apparatus are listed, and a valuable feature of the catalogue which will commend itself to the engineer is thirty-two pages of ready reference tables applicable to industrial uses.

USING TOOL HEAD ON POPPET BARREL

By J. HARDY

The plan view illustrates an arrangement that was devised to do a part of the machining of a casting on an engine lathe, the pair of tools, for recessing and chamfering, being fed up from a casting fitted over the nose of the poppet barrel. A pilot bar centred the head. As a means of taking the torsional effort without imposing any strain upon the barrel spline or its key, the dodge of tacking on a piece of bar, A, was adopted, this bar lying on the top of the lathe bed, a practice that answered successfully.

SECTIONAL VIEW THROUGH THE CHUCK.



DEVELOPMENTS IN SHOP EQUIPMENT

BURTON LOCOMOTIVES

The Burton Engineering and Machinery Co., Cincinnati, Ohio, have placed on the market a line of gasoline and kerosene locomotives suitable and adaptable for any gauge track.

GENERAL VIEW OF THE LOCOMOTIVE IN ACTION.

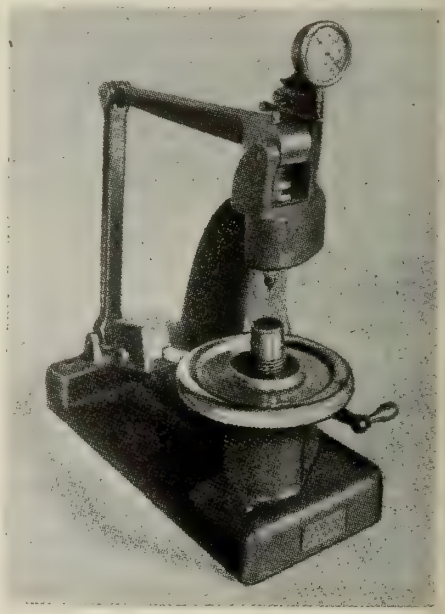
These locomotives are designed to operate with either gasoline or kerosene, and are built in sizes ranging from 3½ tons to 12 tons. Simplicity of construction and operation are the essential features as the power is transmitted through a spur friction, 22 inches in diameter, on a large shaft carried on Hyatt heavy duty bearings.

The jack shaft is on heavy duty Hvatt bearings driven by steel roller chains having ¾-inch rollers, 1¼-inch pitch, and the final drive to semi-steel wheels with chilled flange and rim ground to a true running surface. These wheels are pressed and keyed on special axles which are mounted on extra large Hyatt standard bearings in journal box, carried on coiled springs of the proper size to insure smooth running, with ample provision for lubrication. Steel roller chains and cast steel sprockets are used throughout, eliminating all gears.

The friction control is operated by hand lever, brake by hand lever, speed chains by special locking device, and engine controls are all within easy reach.

The cab is of wood and metal construction, extending the entire length of the locomotive, providing ample room for the operator, and giving free access to all parts of the locomotive. The motor is the latest type of Herschell-Spillman, four-cylinder cast in block, equipped with Bosch high tension magneto, zenith automatic carburetor, Pierce mechanical-driven governor, and radiator with cast iron shell, honeycomb core, spring hangers, which absorb all shocks, which a machine of this type is subject to. There is also a guard in front of the radiator to protect it from damage by articles protruding from cars in actual work. All complicated parts such as gears, differentials, clutches, licensed engineers, are eliminated. It has any speed forward or backward with equal power in both directions. All parts are accessible for cleaning and adjusting.

Brakes on all wheels have a special equalizing device with large cast-iron brake shoes. This device has a powerful leverage, capable of locking all four wheels by means of hand lever conveniently located for operator. Another very important feature of the braking system is the sand device. The sand box is so located that the exhaust from the motor passes through the same, keeping the sand hot at all times, and in a condition to run freely. The control of sanders is by foot pedal, conveniently located for the operator.



Another important feature is the cooling system, which is thermo-syphon, with radiator located in front of motor. The radiator is of a large capacity with cost iron shell hung on a special shock-absorbing device. One of the special features of the cooling system is the reversible fan blades which automatically reverse when the locomotive is run backward or forward. This insures cooling at all times.

The control by friction drive is conveniently located and the friction disc is protected from grease and dirt by a cast iron shield.

HARDNESS TESTER

S. P. Rockwell, 122 Dickerson St., Syracuse, N.Y., has placed on the market a hardness tester for use in testing the hardness of all kinds of metals by the Brinell method.

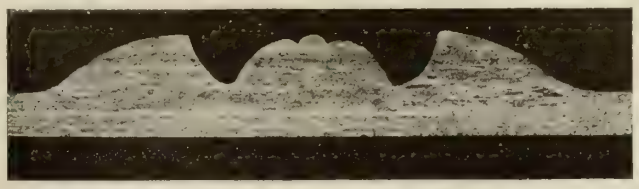
It is claimed that this machine gives very accurate results and that it is adapted for testing both curved or flat surfaces and either thin or thick sections. It operates rapidly, and may be carried around without trouble. Another important feature is that it does not excessively mark or destroy the

ROCKWELL HARDNESS TESTER.

work on which a test is made, and that the machine is adapted for testing the hardness of all metals ranging from lead to hardened steel. The machine consists of a sturdy hollow cast frame and a plunger, which holds the testing point at one end and abuts against a delicate measuring device at the other end. A series of levers with knife-edges connects this plunger with a weight, and by shifting the position of the weight, more or less force may be applied to the testing point to suit conditions.

A vertical movable chuck holds the piece on which a hardness test is to be made, this chuck being actuated by a handwheel. The piece to be tested is placed in this chuck and raised by the handwheel until it comes into contact with the testing point. At this moment, the initial pressure is applied through the point to the work, in order to cause the point to break through the light scale, decarbonization, etc., so that it may more clearly test the condition of the true metal beneath. Upward movement of the work is continued until the plunger has actuated the measuring device to a degree sufficient for testing; then the final weight is applied by a hand-lever, and the hardness is read direct by the difference of the testing point's position as indicated by a measuring device. The elasticity of the metal may also be determined by the test point's difference of position from final pressure to initial pressure.

With an equipment of this kind, an average operator can readily make six tests per minute. The greatest value of this machine for shop use is as a comparative tester. For such work, hardness limits are established by the Brinell, scleroscope, file, or working tests, and the Rockwell hardness tester is then set for the particular class of work on which it is to be used, and its limits are established. If so desired, the indicating dial can be calibrated in Brinell, scleroscope, or percentage hardness numbers, using electrolytic iron as zero per cent. soft. Such dials are available as a special equipment. All work has allowable variations in hardness, and for fast operation of this instrument an extra pointer may be provided. The angular difference in the position of the two pointers represents the allowable hardness variation; and if in operation the two pointers straddle the graduation indicating mean hardness, the work comes within the specified limits. Failure to straddle the mean graduation indicates that the work is too hard if the pointers are on one side, or too soft if they are at the opposite side.

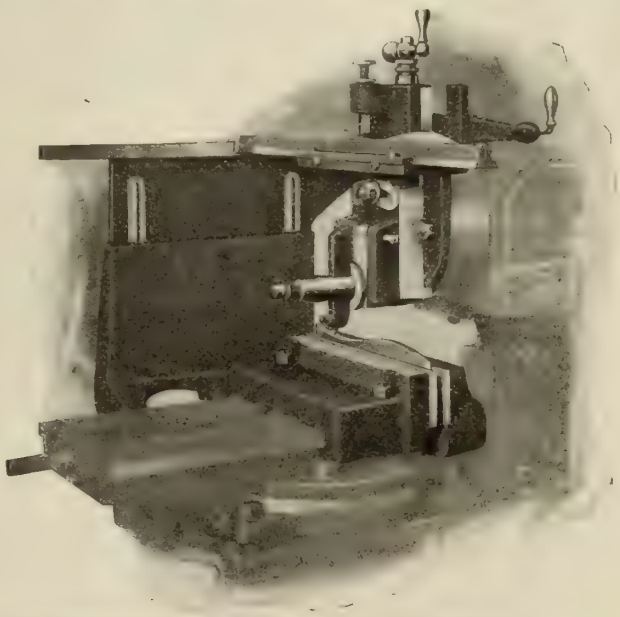


In view of the increasing need for readily applicable means for hardness testing, convenient and simple to operate, the machine described constitutes an interesting development which will, in addition to other means already available, make it possible to control the quality of manufactured articles, especially those subjected to various heat-treatments.

SHAPER ATTACHMENT

The Stockbridge Machine Co., Worcester, Mass., have placed on the market an irregular curve attachment used in conjunction with their shaper. The illustration with this notice explains matters fully. This attachment is used to plane or shape curves, and ensures absolute duplication, on split dies, and other similar classes of work. Forming dies and blocks for a large variety of work are easily shaped and duplication possible any time when required.

ONE STYLE OF CURVE.



A PECULIAR SHAPED PIECE PRODUCED BY THE ATTACHMENT.

The larger class of work in which this attachment is found a necessity is, of course, die work, bending forms and formed tools, but many special jobs that are difficult of machining can be done with this attachment and cost reduced. The illustrations indicate in a general way the possible range in curves and angles that can be reproduced. It will not only reproduce the curve of the templet once, but over and over again at one setting, or at any future time reproduce the identical shape of the original.

The templet carried in the cross-slide holder is made from about ½ in. x ¼ in. stock shaped to the required outline of surface to be duplicated. The cutting tool is directly beneath the follower and it is raised and lowered as the follower moves along on the surface on the templet and reproduces its curves and angles.

Attachment can be furnished with all sizes of Stockbridge shapers; it is interchangeable with the regular Stockbridge shaper head and can be furnished either on the shaper without regular head or as an addition to regular head.

Many of the formed tools used on automatics can be shaped to good advantage and at a large saving over the usual methods.

VIEW SHOWING THE ATTACHMENT IN OPERATION.

As the result of a series of experiments on twist drills, recently undertaken at the engineering experiment station of the Illinois University, the following lubricants are recommended:—For tool steel—lard oil, machine oil, turpentine, soda-water, kerosene; for soft steel—lard oil, machine oil, soda-water; for cast iron—dry or compressed air; for brass—dry or paraffin oil; for aluminium—kerosene, soda-water, and aqualine and soda-water. Various compounds are also suggested, such as:—For steel—boil together lard oil one-third and soda-water two-thirds; for steel—heat together borax 7 lb., and water 40 gallons. When cool add 7 gallons of lard oil; for steel—a thin drilling compound, almost water—enough compound to make smooth and to prevent rust; for aluminium—half kerosene and half lard oil.

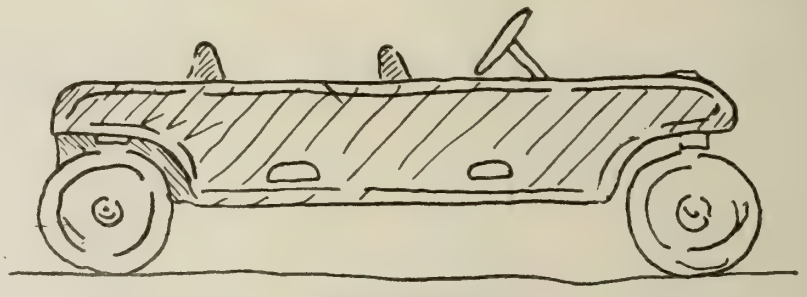
A Peep Into the Future; Ford Is Outdone

Mechanical Inventive Genius Will Undoubtedly be Equal to the Tasks Imposed in Future Years as Witness the Following Article. We Are Indebted to "The Engineer" for This Flight of Pure Imagination

A Christmas Story of 1930

WHEN Mr. James Mass asserted little more than a year ago that he was prepared to flood Europe with a £50 motor car, he was regarded rather as a madman than a knave, but when he began actually to find capital by the simple expedient of accepting fully-paid orders for cars which he had not even begun to build and for the construction of which neither the works nor the machinery existed, opinion veered round to the opposite point, and there were not wanting those who dubbed him a rogue and a charlatan practising on the gullibility of the public through a remarkable personality. So strongly at length did feeling run when it was obvious that more than the twenty million pounds would undoubtedly be subscribed, that deputations waited upon Cabinet Ministers to implore them to take steps to stop this wholesale robbery of the public and to prevent the kingdom being made the laughing-stock of the world. But the Government took no action, possibly because the members themselves had ordered their Mass cars, or possibly because they recognized that whether the people were fools or not, they were carried away by the daring Mr. Mass, convinced of his honesty and determined at all costs to support an enterprise which, if it were successful, would put the kingdom in the forefront of industrial pioneers, and which, if it failed, would cost them no more than the price of a few suits of clothes.

Within a month of issuing his prospectus Mr. Mass was sure of his capital; before three months had elapsed the vast factory at Aston began to rise from the ground, and nine months later the announcement was made that the first batch of cars had been completed, had run their tests on the private track of the company, and had been placed in the bonded store where they are to remain until the day when ten thousand are ready for simultaneous delivery. That day is now rapidly approaching, and it is confidently expected that before the month is out Mr. Mass will have replied effectively to all his critics, and that those who were daring enough to set the example to others by investing their money will be the happy possessors of cars as remarkable for their design as for their method of production.



It is well known that Mr. Mass has insisted on the preservation of the closest secrecy about both the factory and its product, and that every member of his staff and every one of his workmen have entered with as much zest into this condition as they have into the endeavor to realize the aspirations of the great inventor. We believe we may say with precise truth that up till a few days ago not a single soul outside the Aston factory knew how the £50 car was made or what it was like. That Mr. Mass has consented to allow us to lift the corner of the veil, we must ascribe as much to the fact that in a few days' time ten thousand Mass cars will be on the road, as to the flattering reasons Mr. Mass gave us. Even now we should betray his confidence did we give more than the broadest description of the works and of the car, and to tell the truth we are not, in any case, in a position to do much more, for causes which will appear in their proper places.

The Mass Car

First, as regards the car. Chatting about it to Mr. Mass before our all-too-hurried inspection of the factory, he sketched its outline on a scrap of paper, and as that rough sketch may some day have historical interest, we give herewith a facsimile reproduction.

The reader will be at once struck by the extreme severity of its line; he will observe that there are no doors, no splash guards and no visible springs, and if a back view were presented he would be astonished to see no back axle and no differential, whilst in the front view he would see no steering gear. As a matter of fact, the body is a box without any of the projections from the bottom or sides to which we are habituated. The traveller enters it by stepping in over the side, indented footsteps being provided to assist him. The omission of doors has a two-fold effect; in the first place, it reduces cost materially, and, in the second, it admits the characteristic feature of the Mass car, which is the employment of the body itself as the chassis framework.

The body is built of two deeply pressed steel sides held together by the bottom and ends, and by four hollow transoms, one at the back of each seat and one just under the knees of the travelers. It forms, thus, a very stiff framework. The four wheels are quite independent, and each is carried on a stub axle, from which, by the way, it cannot be separated. Each stub axle is provided with a vertically projecting rod or plunger on which a helical spring of special design is threaded. The spring and plungers enter tubes welded into the body. To the summits of the front plungers the steering levers are attached, and they are thus entirely enclosed and out of all danger of shock or dirt. The plungers of the driving wheels are coupled by a pair of hinged transoms, thus forming a jointed frame. Between these two transoms is placed the engine, which drives straight on to external helical gear on the wheels. One word must be said about the wheels. They are of the pressed disc pattern, and the tires are a permanent attachment to them. It is only a few years since the pneumatic tire went finally out of use, but it is hardly necessary to say that the tires on the Mass car are not pneumatic.

THE MASS MOTOR CAR.

The Engine

The engine baffles us—though we have our suspicions—and the best course in dealing with it will be, perhaps, to reproduce as nearly as we can recall it, our conversation with the inventor.

"Placed as it is, Mr. Mass, your engine must be of very remarkable design?"

"Yes, it departs altogether from normal motor car practice. All that is visible from the outside are three somewhat similar steel casings. The first we call the generator, the second the motor, and the third the condenser."

"It is not an internal combustion engine, then?"

"Certainly not what is generally meant by an internal combustion engine."

"Might it be described as a steam engine—or steam turbine, perhaps?"

"It would be wrong to do so, for steam is not used in it."

"You excite our curiosity. May we make one guess? A mercury vapor engine?"

"What, with mercury at its present figure! Half the price of the car would go in mercury."

"Can't you give us just a little hint?"

"Did you ever hear of Arnostedium?"

"The liquid metallic alloy? Of course, but—

"Now, no more questions on that route. Switch off. You want to know why there is no differential. I will tell you. Because there are virtually two engines, one to each wheel, although the harmony between the two is automatic and perfect."

"But you make the engine harder than ever to understand. It can't be a turbine—

"You will have to amuse yourself thinking it out."

"I shall buy a car and see!"

"I'm afraid not. When the parts of the motor are in place the casing is electrically welded up."

"But what about repairs?"

"There are no repairs on a Mass car. If you want a new engine, send us back the old one and seven pounds ten. If you want a new front wheel, drop the old one out and return it to us with thirty shillings. We replace parts en bloc, not details, and we set our face against repairs, both because they are absurdly costly and because they are dangerous. When you are using the remarkable materials we employ, to entrust the heat treatment to a wayside smith is just looking for disaster."

"Do tell us one more thing about this fascinating motor. The fuel?"

"A solid fuel. Endothermite."

"Endothermite! You are joking. It is far too dangerous."

"It is far less dangerous than petrol. I agree that ignition once started is irresistible, but consider how difficult it is to start it."

"How do you start it."

"Now, now," said Mr. Mass playfully. "Break away there and come and see how we put our cars together."

The Works

We descended in a lift, and crossing a yard that was a model of tidiness, entered a doorway on the ground floor of a five-storey building. There are at present twenty of these buildings, all exactly the same, both internally and externally, and there is space for the accommodation of at least as many more. A branch railway runs across the front, and brings the raw material to the very doors. At the other end ramps run down to the charging and dispatching houses and to the great store. Around the works extends a trial course, now completely enclosed by hedges and hoardings, so that none of the cars are visible to the public.

In front of the building we entered stood a train of railway wagons full of steel plates. A bundle of these plates was picked up by a magnetic crane and carried right into the shop, where it at once entered a machine which automatically cut the ties and separated the plates. Leaving this machine on a conveyor, the plates were carried in rapid succession to a series of gigantic presses, from the last of which they emerged in the form of one half of a body, with half ends and half floors included. A series of presses lying parallel to the first and working in absolute unison with them was producing similar sides. Two parts left the last presses at the same moment, were brought together by the convergence of the conveyors, and entered the assembling and welding machine. Here nothing was to be seen, but on leaving the casing in which the operation was conducted, the two parts were completely welded into a single part. The car body was then transported to another machine which was connected to the floor above by four trunks. Down these trunks, Mr. Mass informed us, descended the four transoms already referred to. They were guided automatically into their correct positions, and were welded on with the ease and regularity of soldering cans in a tinning factory. The bodies then entered a final welding machine, in which the tubes for the springs were attached, and as they emerged from the end we caught a glance of them in their rapid passage to the painting enclosure. Here they were painted all over, inside and out, by spraying. They then entered a drying chamber of great extent, into which we peeped through glass windows.

Fifteen minutes is sufficient in this room to harden the special paint used. The last operation on the body is lining out, which is performed by paint wheels carried on long arms. The body leaves the final drying room bottom upwards.

The Erecting Towers

We are all familiar with erecting platforms of the Ford type. They travel horizontally. At the Mass works the movement is vertical; and for this reason: The various parts are made on separate floors; to bring all the parts to one floor would cause waste of time. The crescent car passes through the floors and picks up its parts as it goes. Each floor has its own moving platforms which lead to the erecting towers. The journey of the car through the towers is not continuous, but intermittent. There are eight floors in all, four up and four down, and it stops at each floor for about five minutes. In other words erection is completed in forty minutes. The same men, four in all, travel with it the whole way in each tower. At the first floor the wheels with springs are put in position; at the second the engine is dropped into place; at the third, the generator and condenser are fixed; at the fourth, the brakes are fitted and the final adjustments under the car are made.

Up to this point the car has been upside down—a very convenient position for the work to be done. The up-gang of erectors now leave it, and the conveyor carries it round a bend at the top of the building to the down-tower, which it enters in the upright position, standing on its own wheels. In its passage down it receives its upholstery—all made as separate items and attached by clips to the body—steering gear, lighting units and lamps, brake lever, fuel container, etc., and all the connections to the dash—which, by the way, is attached as a single unit—are also made. When it reaches the bottom again it is a complete car and runs on its own wheels to the filling shed. There it receives a charge of endothermite and passes to the running shed, where it is at once boarded by a chauffeur, who takes it out immediately for a run of fifty miles round a special track provided with all sorts of devices for testing every part anl all the qualities of the car.

Fitting, etc.

We have seen something of the manufacture of the parts of the car, with the exception of the engine, but are not permitted to say anything about it. The principle is mass production throughout on highly specialized machines. Some of the tools are like gigantic full automatics. The stub axles, for example, go in as rough drop stampings and emerge machined all over and are borne straight off to the hardening shop and thence to the grinders.

We were informed that not a single gauge is to be found anywhere in the shops, and that not a single measurement of any kind by anyone but a tool setter is permitted. Mr. Mass holds that no gauges are so good or so cheap as the parts themselves. He says that if you make one hundred parts that have to fit another hundred parts, and you take one or two pairs at random and try them together, if they fit it is certain as can be that all the others will do so, too. To put this principle in practice, light high-speed runways traverse the machine shops. Every now and then a boy snaps up a part and drops it into a tray on these runways. It is carried forward to another part of the works, where another boy takes it and tries it against the part it has to fit. Exchange of this kind goes on continuously all day. In the event of a part failing to fit, the boy informs the foreman, who presses a button, and instantly all production of all kind in that building is arrested. This happened two or three times in the early days of manufacturing, but Mr. Mass told us that not a single case had occurred for three months, and he does not see why one should.

Of course, there is no drawing-office in the factory—there is one in the tool works—for there is nothing to draw, and Mr. Mass is resolved that there shall not be. No alteration of any kind will be permitted in the car for at least five years, when he hopes to have written off his whole capital, and can then think about changes—if any are needed

After this all-too-hurried survey of the factory, we returned to Mr. Mass's room. It would be wrong to call it an office, for Mr. Mass holds that the rooms in which we have to pass a very large part of every day should be as attractive and comfortable as those in our homes. "Now, tell me," he said, as we settled down to a cup of tea, "what struck you most in the factory?" We replied that though we felt it was not what we were expected to say, the things that had given us the greatest surprise were the

lack of haste and the lack of noise. He appeared to be delighted with the answer.

"The essence of all progress, the essence of all science," he exclaimed, "is harmony. The music of the spheres is not audible music, but the harmony of movement of the stars in their courses. The beauty of a machine is of the same order—observe the harmony with which the corporate parts interact. So, too, with science of all kinds; the laws of all science are harmonious, and if any law seems to clash with other laws, if it makes a discord with them, we know it is at fault. A great factory, this beautiful factory you have seen to-day, is founded on harmony. All the parts fit together with perfect concord. Of course, there is no hurrying; why should there be? Hurry is the result of a lack of harmonious arrangement. If you tether a donkey with a hackney, the donkey will have to hurry and strain to keep up, but put two hackneys together and they work together with an ease of effort that gives us pleasure to observe. If part of these works were slower than other parts, the slow parts would be donkeys. The secret of success is for all parts to work at the same pace. The departments of this factory are geared together with the exactness and precision of the wheels of a watch. That is why you saw no hurrying.

"You perhaps observed that the factory is cut up into twenty exactly similar units, and perhaps wondered why it was. Let me tell you. Suppose there were twenty men with but one stomach between them; if that stomach got a pain in it, all the men would be laid up at once. But if each man had his own stomach—you see, of course. Each unit of this factory is complete in every detail; it has its own power-house, its own staff, its own operators, its own railway lines, its own plant. Each delivers its quantum of cars quite independently of the others every day. They all feed the common store. The only other things in common are a single selling agency and a single purchasing agency.

"Let us turn to the question of harmony. All our workpeople are in harmony. You will have noticed that there are no women or girls about the factory. Sex is prone to cause discords—that is why. Every man in the place is an original shareholder; every one paid his £50 for his car, and all will receive their cars in due rotation. There is not a man in the place that belongs to a union or is classed as a workman. They are all well educated, many of them highly educated, and without exception they have a taste for art in some form or for literature. They can do anything in the factory, and they all do; we all can. If a man falls sick, it is sometimes my privilege to take his place. I enjoy a week or two in the towers immensely, and the members of whatever gang I happen to be working with treat me exactly like their missing fellow. Sometimes I get terribly chipped because I am a bit clumsier than the regular hands. By moving the men from one job to another their interest is maintained, but nearly all the work is, as a matter of fact, fairly interesting. At least, there is no monotonous drudgery. Whenever drudgery has to be done we get a machine to do it. At first I bought the few chains we used, but when I had seen them being made I resolved never to buy another. Go to a chain factory and you will understand why. It is hateful to me to see a woman or young girl seated all day, week after week, pushing little bits of steel into a punching machine. It is gross degradation of humanity. Machines make all our chains from start to finish. They are complicated machines and the men take great pleasure in them. You saw our little axles being made. In most works single-operation lathes operated by girls would be used for such work. Here you saw them finished complete by machinery.

"You saw also our system of inspection and noticed our nippers picking up parts here and there, and chucking them into the conveyors. Happy young rascals! They only work in the shops for two hours a day—the rest they spend in our school where we are making future men of them—and as you may have noticed, they enjoy the sport. We put lads on the job because we want a little mischief in it. The more tricks they get up to, the more completely they test our interchangeability. The conveyor system keeps a measure of control over them, and their masters, who go into the shops with them exercise beneficent restraint.

"One word more, and that on the question of noise. Noise is absolutely abominable to all of us, both because it is inharmonic in itself, and because it simply shouts of inharmony in the machine producing it. A perfect machine is noiseless. We have not yet reached that state of perfection, but I am delighted that you noticed we were getting near to it.

"There, there, I am monopolizing the conversation, but it is your own fault, you appeared to be interested."

We assured him that we were.

"Are there any points you would like me to explain?" he asked.

"Many," said we. "First, there is the engine. The patent drawings—"

He burst into laughter. "There is not a single patent in the whole car."

"What!" said we in surprise.

"Not one," said he. "After June 1st any one that likes may copy our car. It isn't patents that make success, but the means of production. We have got the start of the world and defy others to catch us up, let them try never so hard."

As I rose to leave him, I addressed a final question.

"No, sir," he said, "we have no agents, but we are arranging depots for spares all over the country. Good-bye. Do come on June 1st and drive one of the cars. There is nothing to learn. Good-bye; good-bye!"

ACCURATE GAUGES OF PLASTER OF PARIS

By Donald A. Hampson.

Every business has its pivot men—men who are scarce and about whose skill the whole fabric swings—men who correspond to the tenor of the opera and the baseball pitcher. In the manufacture of straw hats, there are two such positions and one competent man in each takes care of the wants of a plant of about five hundred other employees. These men are known respectively as the "whittler" and the "moulder."

The whittler is a wood carver de luxe. His work is to make wood patterns or models for all the various sizes and shapes of hat crowns and brims, to make plaster of paris casts from these, duplicates and many other parts that require the hand and eye of an artist. The moulder makes spelter dies from the plaster casts and dresses them up to a degree of smoothness and fit. These dies go in presses and the sewed forms are then pressed into hat shapes to suit the modes of a season. (The hat business uses or has used practically every mechanical movement in its presses and various hydraulic and steam presses as well.)

A whittler named Blake was one of the best in the business and, being mechanically inclined, had devised many improvements in other branches of the work than his own. His broad experience made him a man sought after and he frequently contracted for a year away from the home shop.

It was while he was thus working several hundred miles away that I made the acquaintance of his plaster of Paris gauges. Our experience in the line and the patterns we had gradually made up brought us repair work from distant points. Usually the old parts were sent, but Mr. Blake's method was to make a cast in reverse of the part wanted and send that to go by for the important measurements.

The male piece was always just the size the slot should be planed in the mating casting, and the female piece just how much freedom should be allowed for a sliding fit of the tongue. Without knowing it, some of these gauges that he made were of surprising accuracy, and the fact that they were unaffected by temperature was an important item. Though this man never saw a micrometer, these parts, which he would call ordinary work, could not be made closer than 0.001 in. than they are and show the kind of fit that is wanted.

All of which goes to show that there are other ways than ours, and that this one might sometimes be copied by machinists in general

The Betson Plastic Fire Brick Co., Inc., Rome, N.Y., have issued a folder descriptive of the Betson one-piece permanent baffle for water-tube boilers.

Troubles in Electric Furnace Operation

Mechanical and Electrical Features of Furnace Design Which Are Liable to Give Trouble if Not Guarded Against. Most of These Are Simple in Themselves, But Cause Much Inconvenience

By W. F. SUTHERLAND

NOT so very long ago an engineer who ought to have known better asked an electrical furnace operator in a Canadian plant just what burned inside and how the heat was generated. While his knowledge embraced a wide range of subjects, it did not extend to the subject of electro-metallurgy. His position in many respects corresponds to that of many plant engineers who have the purchase of equipment of this character in their hands.

In its essentials a comparatively simple mechanism, the proper design of both mechanical and electrical parts has a lot to do with successful operation.

The engineer, purchasing a furnace of any type, should carefully examine its design and the following sources of trouble may serve to indicate some of the weak spots.

The design of the doors is an important item. They should be so constructed as to present considerable resistance to the warping action of the hot interior of the furnace and the guides should be designed with this in view. Reasonable tightness is desirable and the more nearly gas tight the door is, the larger will be the life which may reasonably be expected.

The subject of counterweighting is one which should be carefully studied. Doors which require three or four men on the end of the counterweight lever to open them are worse than useless and money will have to be spent in the remodelling of the equipment.

Electric furnaces are built without exception with removable roofs or tops and the provision for changing roofs should receive attention. Not only should the roof be easily removable but the design should be such that the refractory brick can be laid up easily. It should also be borne in mind that the fewer the openings and the smaller their size —the longer the life which may be expected.

Electrode Gears

Electrode breakage is a very material item of expense in the operation of some furnaces and attention might well be paid to the design of the electrode gear for its minimization. In some designs a jib holding the electrode clamp projects from a structural steel mast and is arranged for vertical travel in this mast. The usual means of effecting this travel is to have wheels fastened to the jib and bearing on the inside of the flanges of the steel members of which the mast is made. It is obvious that the diameter of these wheels must be less than the width between flanges, but if there is much more than ¼ in. clearance trouble may be expected.

With the electrode hanging free in the furnace and not in contact with the charge the bottom guide wheels on the jib bear on the flange of the I-beam or channel furthest from the electrodes and the top ones bear on the near flange.

Should the electrode travel downwards until it is in contact with the charge, the position of these guide wheels is reversed owing to the release of the weight and the pressure upwards. This results in the turning of the electrode through a small vertical angle, depending on the wheel clearance and if the latter is of sufficient magnitude the electrode will likely bind on the charge and roof-ring of the furnace or may pinch in the electrode hole with resulting breakage. In one case, it was no uncommon occurrence to break several electrodes during the course of the day's run from this cause alone.

The jib is usually raised and lowered by means of a wire cable running over sheaves to an electrically operated winch. The method of attaching this cable is of some importance, for if it is simply passed through a punched hole in a plate cutting may be expected. Thimbles should always be used for the fastening of cables in this manner.

Mention has been made of the clearance of the jib guide wheels in the mast. Of almost equal importance is the clearance in a direction at right angles to the former. If this is not made of small amount, the electrode and its supporting mechanism will wobble sideways with harmful results.

The tilting gear is of much importance and it is essential that the motor be of a rugged type and its location well protected from splashings of hot metal and flying slag, to say nothing of the miscellaneous foundry dirt which is sure to find its way into the pit. The tilting motor control should be of an extremely rugged type and totally enclosed. All connections should be made in conduit.

A worm gear drive is usually incorporated into the tilting mechanism and it is of importance to notice that the worm gear should be of bronze. Cast iron is not a suitable material and is liable to cut. For the sector gears cast iron is suitable if the proportions are correct and allowance made for the heavy work which has to be performed. In some types of furnaces the sector gears take more than half the total weight of the furnace, and the importance of proper design can hardly be overestimated. Any failure of the tilting mechanism when pouring involves much inconvenience and at times considerable loss.

Direct current is usually used for operating the electrode and tilting motors when it is available and in this case dynamic breaking is usually resorted to. When alternating current is the only kind available, recourse must be had to solenoid-operated brakes for checking electrode travel and tilting. In this case, it is important to properly proportion the solenoid for proper current carrying capacity coils for heat dissipation. Burned-out coils are a source of annoyance and expense which can easily be obviated by proper design.

With automatic regulation it is important to see that a no-voltage attachment is provided. Without it, if the power supply is cut off through line failure the transformer switch opening, the regulator immediately starts the electrode travelling downwards with disastrous results to the electrode or its gear. With the no-voltage feature the regulator immediately ceases to function and the electrodes remain stationary unless hand control is used or until the power comes on again. It is important also to notice whether this no-voltage feature functions properly. If it does not, it is worse than useless since it only gives one a sense of security which is utterly false.

Ammeters are usually provided and in most cases they are installed in the regulator circuit. Care should be taken to see that they are of the proper scale to correspond to the current transformers. Thus, if the current transformers have a ratio of 4,000/5 amps., the ammeters should show a full scale deflection of 4,000 amperes when traversed by a current of 5 amps.

The ammeters should also be correctly installed in the secondary circuit of the transformers. This circuit is essentially of the series type, although modified by a parallel connection to the regulator rheostat. The ammeters should be installed in such a manner that all of the current generated by the secondary e.m.f. of the transformer passes through them and so that none of it is shunted by the rheostat above mentioned.

Low Tension Leads

Soldered connections should never be used on the low tension leads since any local heating is sure to melt the solder. Lugs should be cast on the leads or clamp connectors, if used, should be designed for ample current carrying capacity.

It is preferable to have an inverse time limit relay installed in connection with the transformer oil switch. This feature minimizes outage time particularly in the breaking down period.

Queer Ideas About Schools

THE chairman of the Toronto Board of Education is Dr. Noble. In his remarks at the first of the year on the occasion of the first meeting, he is reported to have said that he would not teach a child to read until a desire was created to get information from the printed page. Spelling he would teach hardly at all and geography only incidentally. "Why teach arithmetic in an age when we have adding machines?" he asks. Dr. Noble would have cafeterias, dancing, swimming tanks, etc., also movies.

Toronto is the reputed educational centre of Ontario. It is quite right that other places should look to this city for sane leadership in these matters.

It has not been claimed that Dr. Noble was misrepresented, and so it seems that his strange statements must stand.

"Why teach arithmetic in an age when we have adding machines?"

There would be equal sense in crying out: "Why teach or allow children to walk when we have automobiles?"

The adding machine is representative of fine mechanical work. It is a triumph to the brains of skilled inventors, designers and mechanics. Had Dr. Noble's childlike philosophy been in vogue, there would be no adding machines, there would be no gramophones that he urges for the schools.

Ask the mechanic who takes his trade seriously if he regrets having learned arithmetic. He will tell you that his regret was not that he learned it, but that he did not learn more of it.

Then there is that strange idea of not teaching the child to read until a desire had been created to get information from the printed page. Follow that to its logical conclusion and we have this: If the child has no desire to secure this information, let him slide. The sliders would be more numerous than those who had been roused by "the desire to obtain knowledge from the printed page."

The school system of this country should, more and more, bend to the practical. There are enough frills hitched on it now.

As far as this paper is concerned, we would much rather take the word of a man like Robert Patterson, of Stratford, who for 20 years was Master Mechanic of the Grand Trunk shops at Stratford, and an outstanding success in the matter of training apprentices. Would he urge less attention to mathematics in the schools? Not much. He would urge more attention. Would he pile on frills at the expense of essentials? He would not.

Only a few weeks ago CANADIAN MACHINERY discussed these matters at considerable length with Mr. Patterson. His criticism of our education plan is not destructive, like Dr. Noble's. His ideas are constructive. He favors teaching boys in the shops, and teaching them the subjects they must excel in in order to be leaders in their trades. He realizes that the tendency of the age will, of itself, keep boys from taking work or education too seriously. He has seen too many boys, from a lack of education, from habits of drift formed in their plastic years, shuffle off into the world with nothing to sell but their brute force to do hard, manual labor.

It is too bad that Dr. Noble had not taken the trouble to consult the industrial leaders before letting fly his half-baked ideas about freak schools.

New Cause For a Strike

THE president of the One Big Union in Fernie, B.C., is William Potter. He got on the train that runs up to the mines at Coal Creek, but would not pay his fare. He was ordered off, and as a result the miners refused to go to work.

Coal Creek, by the way, is the place where the Crow's Nest Pass Coal & Coke Co. operate. It is five miles from Fernie, but nearly all the miners live at Fernie, for the very good reason that the mountains have not left enough room for them to live at Coal Creek.

In one way we're inclined to agree with Bill. Perhaps he reckoned his ride up on the mine train was not worth paying for. That has always been an open question. The best commentary on the train is that in fine weather most of the men prefer to sit around the edge of flat cars.

But Bill getting put off the train was enough to keep the morning shift out of the mines. It was, in fact, an enormous offence. The idea of the president of the One Big Union being forced to leg it up to the mines is sad. Going up to the Creek is a stiff grade—it goes up some 500 feet in five miles. Had he been kicked off on the down trip our sympathy would not be disturbed. None of it would be carried off and handed out to One Big Bill.

For years past One Big Unionists and Socialists have been telling the miners and others that some day they would own the mines and everything else. That seed probably got in behind Bill's ear and sprouted. Who knows but on that day he imagined that he had a real honest-to-goodness claim on the mine train? Small wonder that William, as he gazed upon the conductor, recognized in him one of his hired men, and felt quite within his right in telling him to be gone when he asked that Bill should decorate the incoming side of the company's books with his fare that day.

The labor market of British Columbia must be in queer shape when the mines at a camp the size of Coal Creek deem the chucking of Bill from the train for not paying his fare to be sufficient cause for shutting down the mines for the day shift.

Publicity For Canada

THERE has been a great deal of advertising of one kind and another done for Canada, some of which, like the ice palace in Montreal, might have been well dispensed with. The Canadian Pacific Railway has been doing some real constructive advertising in Great Britain lately, which cannot fail to be of value to the Dominion. This has taken the form of illustrated lectures, the illustrations being carried out by a moving picture machine, showing the industries of the country in active operation. The first lecture was given in the Central Hall, Westminster, and the industrial views were preceded by a series of scenic subjects, which practically covered the Dominion. Then a film was shown which covered the paper-making industry, from the cutting of the tree, through the logging road, the drive to the mill boom, the sawing, barking, chipping, cooking, and so on to the finished product. The interest manifested by the audience was intense. Following this came a review of the wool industry, likewise traced from the back of the sheep to the finished cloth. Then came the asbestos mines of Quebec, and it was once more demonstrated that the bulk of the world's asbestos supply was concentrated in that Province. The explanatory lecture was introduced by a speech from Sir George McLaren Brown, European manager of the Canadian Pacific Railway, who emphasized the necessity of cementing the component parts of the Empire together in such a manner that disruption would be impossible. Educative propaganda of this kind is of the utmost benefit to Canada, and should have the effect of inducing the very best kind of immigration. We must have immigration if the great resources of this country are to be developed as they should, and scenes from the actual life of the country are a much better means of persuading the intending settler than the doubtful methods employed in the East by unscrupulous immigration agents.

Building up the Liner Fleet

REPORTS from England tell of the launching of two purely passenger liners, one for the fleet of the Pacific Steam Navigation Company, and one for the Anchor Line. These vessels are noteworthy for the fact that they are the first vessels built since the war of the purely liner type. By this it is not meant to convey that they are of the New York route class, but they are designed as liners, and not cargo boats. They also tend to illustrate the lines upon which the replenishing of the passenger fleets of Great Britain will be carried out. The luxurious fast passenger vessel of the "Lusitania" and "Aquitania" class will not be built in the immediate future. The need is for the intermediate type of passenger boat, with a moderate speed of 17 to 18 knots, having ample passenger accommodation, coupled with a relatively large carrying capacity. They will be economical of fuel, and in many cases, in fact, the majority, will be fitted to burn oil fuel. The propelling machinery will be geared turbines. Many of the existing ships of the large passenger lines are being converted from coal burners to oil burners, the greatest of all being the "Aquitania," which is being altered and reconditioned at the yards of Armstrong, Whitworth on the Tyne. The Cunard, Anchor, Anchor-Donaldson, and Anchor-Brocklebank lines are building between them 34 ships, aggregating about 400,000 tons, every one of which will be oil burning, and geared turbine driven. While standardization, as it was understood during the war, cannot be applied to these specially-designed ships, shipowners will build numbers of vessels to the same design, thus allowing them to order all the material for a series of ships well in advance, to the same specifications. The building of the liner fleet, which is so much needed to maintain Britain in the forefront of the maritime world, will proceed from now on with speed and regularity, till she is once more in the forefront, where she can be trusted to remain.

Inaccuracy in Reports

WHILE the average technical article is reliable, and great care is taken to make it so both by the author and the editorial staff of the paper in which it appears, still occasionally someone slips up and an error or false statement palpably inaccurate creeps in. We are referring to a recently-published statement in connection with radiation loss. The point at issue is in the figure of 502° appearing on a chart as the temperature of the exterior wall of the setting. This is pretty warm.

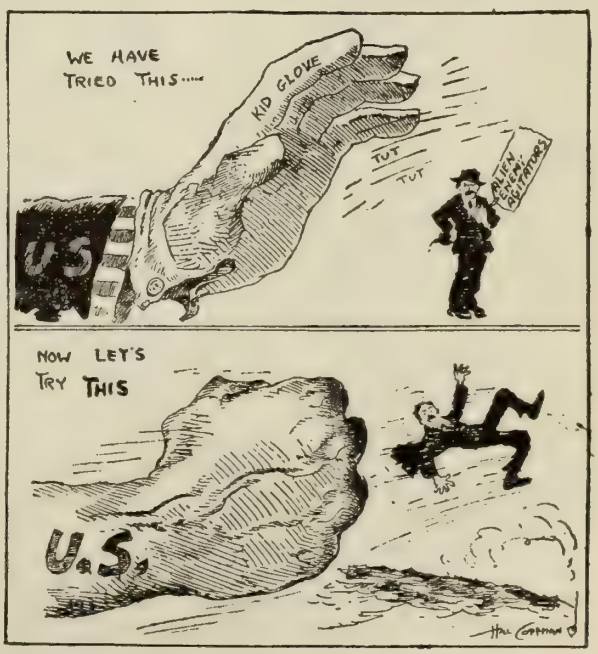
An Iowa inventor has obtained a patent upon a unicycle that is driven by an electric motor and prevented from falling by gyroscopic fly wheels.

On the principle of spring window shades, but operated horizontally, an index that can be attached to desk telephones has been invented.

An international exhibition for the reconstruction of the industrial, agricultural and commercial life of France will be held at Lille from May until October, 1920.

Flames from an oil or gas stove do not come in contact with the food cooked on a new broiler, which consists of hollow tubes, through which pass heated gases generated in a combustion.

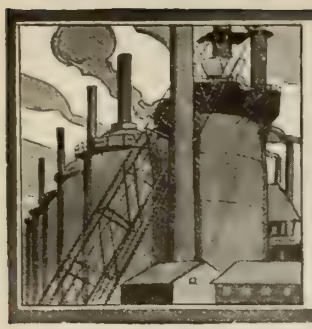
A subterranean river in the Philippines is navigable by small boats for two and a half miles from its mouth, passing through several large stalactite hung caverns.



A partitioned metal tray has been invented that telescopes to fit a desk drawer of any size.

An inventor has equipped the back of a small brush with rubber suction cups to hold it on a wash bowl or other smooth surface for the convenience of one-armed persons.

Chiefly for photographing machinery, a camera has been invented large enough for a man to enter it to change the plates.



To make a motorboat of any craft, an inventor has mounted an engine, shaft and propeller in a hollow fin which he used to replace the boat's keel.

An automobile speedometer has been invented that can be set to regulate the speed of a car and prevent it being

ABOUT TIME.

MARKET DEVELOPMENTS

High Prices and Shortage Still Here

Little Material in Warehouses—Pipe Prices Advance—Production in the Steel Mills is Still Behind—Future Chances of Catching Up Are Not Certain

IN practically all branches of the steel trade a shortage is noticed. There is the same story of depleted stocks from warehouses, and production in the mills nowhere near catching up with the demand. Under these circumstances, there is no difficulty in getting premiums, and sheet mills that have been getting $10 for first quarter, have placed business for second quarter at the same rates. Whether the scarcity will continue into the future or not is a question on which the experts differ. Some think it is a temporary effect caused by the strike, and other adverse factors, and that the mills will catch up when given a reasonable time. Others incline to the opinion that there will be heavy buying by the railways in the near future that will effectually preclude the chances of replenishing stock. The coke situation is improving, but not rapidly enough to suit all parties concerned.

In Toronto there has not been so much activity this past week. Climatic conditions may have something to do with this, and it is expected that a revival will take place with the coming of spring. There has been a good business in small tools, and a large enquiry is out for the Canadian National Railways. Warehouses here are just as short as any other centre.

There has been some good buying in the New York market, in machine tools, a good percentage of which was for woodworking machinery for shipyard use.

MONTREAL STILL SHORT OF BLACK AND GALVANIZED SHEETS

Special to CANADIAN MACHINERY.

IT is reported by local steel dealers that the demand during the past week has declined slightly, but the volume of business is comparatively fair in view of present conditions. The prospect for greater production is looked for in some quarters as a result of the recent calling off of the steel strike, but it is the opinion of some of the dealers that this development will have little material effect upon the operation of the mills, as the situation has gradually adjusted itself until at the present time there are few men still out. It is believed that the early return of the American railroads to the former owners will be the signal for the placement of large orders for railway equipment, and the heavy inquiry for plates is some indication of early future developments. The tube situation maintains its strong position, with supplies hard to obtain. Current prices, in general, show an advance over those of last week, although some prices are never lower. On some of the smaller sizes of seamless the prices are a little easier, but tend upward on the larger tubes. Four-inch is now $85 per hundred feet, an advance of $10 per hundred. Lapweld prices show an approximate advance of 5 per cent. over those last quoted; 1½-inch are now $28, and four-inch are $58.75.

The feature of the week is still the marked scarcity of all classes of sheets, both black and galvanized; it is almost impossible to obtain any of the former and the inability to obtain these keeps the galvanizers from operating at capacity. Warehouses are completely stripped of the majority of sizes in black and galvanized sheets. The prices quoted are those accepted for delivery at convenience. Urgent requirements for 2 to 3 months' shipment are sometimes made at premium prices, but definite data in this regard is difficult to secure. The early spring demand may occasion a much stronger market with a corresponding advance in prices.

Strength Still a Feature

A strong market still prevails in nonferrous metals, and a fair demand marks the week's activities. Copper has fluctuated a little and the current quotation shows a higher price than last quoted. Lake is 25½ cents and electro 24½ cents, an advance in each case of ½ cent per lb. The strength of the English tin market has been reflected here and a nominal price of 72 cents is the base of dealer's quotations. Lead is stronger on good demand, the price of 10¼ cents representing an advance of ¾ cent per lb. Antimony is also ½ cent higher at 12 cents per lb.

Manufacturers Meet Exchange

The delivery on new equipment continues to be the feature of machine tool activity, as shipment of tools coming in from the States cannot be guaranteed for many months. The average period is from six to eight months, and in some instances 1921 has been specified. The rate of exchange now effective is causing some anxiety on the part of both manufacturer and purchaser, and this factor of present business has a tendency to place considerable more business in the hands of Canadian firms than would otherwise be the case. Some American firms are taking this situation into account and dealers here report that U. S. manufacturers are willing to meet prospective buyers on the question of exchange and allow for same if necessary.

Apart from the high exchange rate the tendency is for higher prices on many tools. The week's transactions denote a quieter inquiry for new machines. The demand is widespread and general in character. Considerable business is still done in rebuilt machine tools.

Machinery Scrap Still Leads

With the possible exception of ma-

chinery scrap, which is still to the fore as regards demand, the general situation is comparatively quiet and dealers report few developments of an interesting character. There appears to be a revival in the inquiry as to steel and iron scraps, but little to indicate that buying in the near future will be out of the ordinary. Dealers here state that the market is quite firm, particularly in irons, but some lines of non-ferrous scraps are weakening. Prices, however, are unchanged, but should be considered as nominal.

IS STEEL SHORTAGE OVERRATED NOW?

Some Think So, But Fact Remains That Warehouses and Stock Racks Are Empty

TORONTO.—Business has not been particularly brisk during the week in the Toronto field. It may be that the weather has had the tendency to keep people away from here. Inquiries have been fair, though, and it is fully anticipated that the coming of spring, with its attendant expansion, will see a revival of business in all lines of machinery, small tools, steel, iron, etc.

One of the big questions is that of catching up with the orders that are already on the books of machinery and steel houses. There is a feeling, expressed quite often, that the shortage of steel is being exaggerated in some cases, not so much as affecting the present figures, but in regard to the ability of the steel mills to bring up their production figures to something sufficient to give consumers all the steel they want in reasonable delivery time.

Against all this sort of talk is the fact that there is a shortage in the warehouses. There is a shortage in the stock racks of the consumers. This does not apply only to Canadian, but to American conditions as well. One of the warehouse men who has returned from the States reports that affairs are even worse there than they are in Canada.

"I went to Cleveland, Chicago, Pittsburgh, and other of the best warehousing centres. I wanted to see what the condition was there, and if we were any worse off than those in the same business across the line. There does not seem to have been the same rush of business here as there, for the warehouses in United States are cleaned out entirely in many of the much wanted lines. They are, for the most part, staying with the price schedule that was announced on March 21, but they have nothing to deliver, so what difference does their price list make? The scalpers and the adventurers have been having a good innings lately," he continued. "I believe they can get about any price that comes into their head to ask for. As far as I could see, they were not looking for any immediate relief to the situation, as the mill deliveries are not improving to any extent.

"For instance, it is almost correct to say that you cannot buy tubes now. The warehouses where I visited couldn't sell them because they didn't have them, and saw no chance of replenishing their stocks. Here is something that will show the way some of the prices are going in the States: A firm in Cleveland got a line on 500 tons of blue annealed sheets. Now, remember that the March 21 price was 3.55 base for these, and then put it down that the price asked for this 500-ton lot was 6.50."

This line of material is used largely for tank work, smoke stacks, etc.

There is still some difficulty in securing shipments of British-made goods for this market, but, according to several of those who are following the situation closely, there will be an improvement in the not far distant future.

Progress is being made in putting the war material on the market here, but much of it is scattered in several shops, and it makes it very hard for those in charge to get out definite lists to send to the trade. There was a quick clean-up of desks, chairs, typewriters, and other lines of office furniture that the Ordnance Department had to offer, and practically all that material has gone.

The Machine Tool Market

The buying of equipment for the St. Malo shops of the National Railways has been one of the largest lists sent out to the trade this year. There are some 13 tools in all, and tenders have been sent in by several of the dealers in this district. There is some little criticism regarding the way the Government buys. Dealers claim there is such a long time between the date the tender is put in and the time the business is placed. In that period there is apt to be several changes in prices.

One firm making several lines of grinders announce a five per cent. increase at once.

Dealers handling small tools report a good business. In fact one of these dealers stated that he had done as much business in a week in January than he had turned over in the whole month last year. Deliveries are none too good on some lines of cutters.

POINTS IN WEEK'S MARKETING NOTES

Sheet mills find no trouble in securing a $10 premium.

Foundry pig iron is selling for last half of 1920 at $39, Buffalo.

The belief that railroads would be very much in the market for steel seems to be doubted in some quarters, as the roads will have financial troubles to attend to them.

Most of the large jobbers in United States are selling on the March 21 list, but they have a scanty assortment for sale. The scalpers and adventurers are making merry, though, over all material that comes their way.

Some of the independent pipe mills announce an advance of $10 or $11 a ton on oil country goods.

One maker of grinders announces a five per cent. increase, effective at once. They are paying more for their castings, and other charges have also increased.

An effort is to be made to keep bar prices in Toronto at 4.75, rather tha allow a higher figure.

The National Railways are getting tenders on a list of a dozen or so large tools for the St. Malo shops.

NEW YORK HAS A QUIETER MARKET

THERE ARE SEVERAL FIRMS THAT ARE DOING BUYING ON A FAIRLY LARGE SCALE

Special to CANADIAN MACHINERY.

NEW YORK, Jan. 22.—The largest buying of the past week has been done by the Newport News Shipbuilding & Dry Dock Co., Newport News, Va., whose purchasing department is in the Woolworth Building, New York. The total requirements of the shipbuilding companies is about 250 machines, of which a considerable part is woodworking machinery. Some of the orders were tentatively placed before the close of the year, but confirming orders are just being given.

The Savage Arms Corporation, Utica, N. Y., is inquiring for machine-tool equipment for the manufacture of ball bearings. The Otis Elevator Co., New York, is doing a little buying to round out its recent purchases. Westinghouse, Church, Kerr & Co., New York, are buying the equipment for the extensions of the American Rolling Mills Co., Middletown, O., which will probably include some machine tools.

The General Electric Co., Schenectady, N. Y., continues to buy for its Rochester, N. Y., plant, and has issued new lists totalling about thirty machines.

Otherwise the market is somewhat quieter than it has been for several weeks.

ANNOUNCEMENT

General Forgings and Stampings, Ltd., is the new name of the Canada Pole and Shaft Company, Ltd., Merritton. This change of name has been found advisable owing to the fact that the business has been gradually changing from that of a pole and shaft and woodworking business to that of a forging and stamping business. For a considerable period the company has been operating only on automobile forgings and stampings. This line will be followed exclusively from now on.

IS FUTURE TOO MUCH DISCOUNTED ON THE SHORTAGE IN STEEL MARKET?

Special to CANADIAN MACHINERY.

PITTSBURGH, Jan. 21.—The pig iron and steel markets present certain appearances of growing stronger. Sheet mills that had been obtaining $10 a ton premium, or thereabouts, on first quarter contracts have lately been able to place some contracts for second quarter at the same prices. Some foundry pig iron has gone for the second half of the year at $38 to $39, both f.o.b. valley furnaces and f.o.b. Buffalo furnaces. These, and a few similar items, would suggest that the period of scarcity, which has produced such high prices of late, is expected to be prolonged.

It is too soon, however, to draw general conclusions. Fundamental conditions, particularly financial conditions, are very far from satisfactory, according to the views of nearly all bankers. Then there is the fact that anyone can ascertain by just a little investigation, that the steel market has been relying on some favorable factors that do not really exist. There is, for instance, the expectation, generally entertained, that the railroad companies will be larger buyers immediately, or soon after the lines are returned to their owners March 1. If that were the case, as it seems to be generally assumed in the steel trade it is, railroad men themselves would, presumably, know something about it; but it is quite plain that what railroad men have on their minds at present is the group of serious financial problems they have, to finance the debts they will owe the Government for improvements made during the control period, making it that the lines will be returned to their owners in better condition than when received, and to finance various obligations to mature in the near future. In other words, the steel market appears to have discounted a favorable development that is not going to occur.

Another reason that makes it unsafe to assume that scarcity of pig iron and steel will continue indefinitely is that not enough time has elapsed to test the effect upon the situation as to supply and demand of increasing production. Just now the consuming industries are feeling keenly the effect of the curtailment in production due to the iron and steel strike. While the strike, as a strike, was almost over by December 1, the scarcity of fuel produced by the coal strike, and the car shortage that developed promptly upon the resumption of mining, have operated to retard greatly the resumption of full activity by the iron and steel industry. Even at this date, the production of steel has scarcely returned to the rate obtaining in September, just before the strike started, that rate having been in the neighborhood of 83 per cent. of capacity. When pig iron and steel production rise to 95 or 100 per cent. of capacity, the situation will, presumably, be altered. It is true there are some in the producing ranks who speak as if there is little hope of the industry operating efficiently, and they may be right; but it certainly would be a curious situation for the merchant blast furnaces and the steel mills to be unable to operate satisfactorily, but for the customers of these producers to be able to operate well and to be prepared to take maximum tonnages of their pig iron and steel materials.

Coke Supplies

Production of coke has been increasing steadily at the by-product ovens since the middle of December, when coal was released, as a result of the mining settlement; but the increase has been slow, and much slower than desired. Production in the Connellsville region suffered a back-set at holiday time, while since then it has been at the same rate as obtained the week before Christmas. The Connellsville coke operators have been complaining loudly of car shortage; but it must be remembered that the shortage is in relation to the increased production they desire and their customers desire. In the past three weeks they have been getting as many cars as they were getting before Christmas. The coke supply prevents a number of idle blast furnaces from blowing in, and a few furnaces actually in blast have had to run at less than capacity because of not receiving full supplies of coke. In active times industrially, a shortage of coke at this time of year is the rule rather than the exception, and the shortage is generally relieved before the end of January. In this instance, the shortage may last longer; but even at that, the balance of probability is that there will be an ample supply by the time the worst of the winter weather is over. Present prices, under Government control, $6 for furnace and $7 for foundry, per net ton at ovens, Connellsville region, are very profitable to the producers; but when Government control is removed, the furnaces will be quite willing to pay still higher prices, if they are needed to stimulate production.

Pipe Advance

Several of the independent pipe mills have advanced oil country goods for $10 or $11 a ton, and they can readily obtain the advanced prices for such deliveries as they can make in the next few months, since the producers holding to the old prices are filled with business for a long time to come. Advances in standard steel pipe are also being made. While it is stated there is no concerted action, it is very probable that all but one or two of the independent pipe mills will advance their prices three and a half points, or about $7 a ton, thus putting their card on a 54 per cent. basing discount that ruled from December 12, 1918, to March 21, 1919, when the 57½ per cent. basing discount was adopted, at the time of the Industrial Board's efforts to stabilize prices generally.

Pig Iron

The foundry iron furnaces are sold up tight for several months, and orders for prompt lots can be placed only at premiums, $40 valley being a relatively low price for single carloads of No. 2, while for extended delivery, say late in the second quarter or for second half, the market is firm at $38, valley. A carload of high silicon iron, 3.00 to 3.25 per cent. silicon, has just sold at $46, valley. Bessemer and basic, on moderate sales, are up $2 a ton, to $37, valley, for basic and $38, valley, for Bessemer; but these grades are cheap relative to foundry iron.

There is better news in the nail trade. For some reason or other, the steel strike affected the wire mills, as a whole, more than other branches of the steel industry, and the nail-making departments were especially hard hit. When the strike was practically over elsewhere, nail production was still relatively light. In the past ten days, reports have been of employment being much better in nail departments, and of production increasing very decidedly. The market does not reflect, as yet, any loosening up in the supply, as independent mills are still able to get $4.25 to $4.50 for deliveries over a few weeks, against the American Steel & Wire Company's settling price with its regular trade, which has been $3.25 ever since last March. The great shortage in production is evidenced by the high prices obtained during a period when nails were really out of season.

VENEERING PRESSES

The West Tire Setter Co., Rochester, N.Y., are manufacturing a gluing press that is adaptable to the requirements of paper box and veneer factories, piano, furniture and other woodworking concerns. It is of the hydraulic type, equipped with a belt-driven pump, and is built in various sizes, according to specifications. One of the presses was recently installed by a concern manufacturing cedarized cigar boxes, in which the stock consists of paper veneer over a wood body.

The company reports good business from France in heavy motor car wheel-setting machines.

It is commonly supposed that the Thermos flask was invented in America or Germany. The real facts have been made known by the successful application by Sir James Dewar for an extension of his patent, No. 13,638 of 1904, for, inter alia, the application of a method of absorbing gases to the production of high vacua. In scientific books the Thermos is called the Dewar flask.—Engineering.

BECKER

Belt Driven Millers

The Machine that gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker production. Adopt this "safety-first" course; it may mean added profits to you.

The Week's Events in Montreal Industry

During the past week the Montreal branch of the Manufacturers' Associations has been busy distributing some 200 of the latest industrial census forms for the Dominion Bureau of Statistics. These forms should have been filled out a year ago, but many firms neglected to do so. Every effort is being made to compile these statistics at an early date to avoid the penalty provided for in the Order-in-Council enforcing the sending in of such information.

It is reported that a settlement for compensation may shortly be made to Sir Chas. Ross for the use of the Ross Rifle Factory during the war. It will be remembered that the plant was taken over by the Government and following the expropriation the owner filed a claim for damages to the extent of $18,000,000. The action has been in abeyance for some time, but the Government has again opened negotiations with a view of making an award for the use of the property, which will probably be around $2,000,000.

Canada's present standing and her future possibilities cannot be better shown than by a statement appearing in the recently published annual of the Port of New York. In part it reads: "An interesting point is the fact that Montreal, if a port of the United States, would rank second or next to New York, the value of the foreign commerce now exceeding $700,000,000 in value. As it is, Montreal holds second position in the value of foreign commerce among the ports of the American continent." In regard to other phases of Canadian activity, it is interesting to note the favorable comment that is made in connection with the proposed canalization of the River St. Lawrence, and the bearing it would have on supplying the central American States through the medium of comparatively cheap water transportation.

Many prominent engineers and Government officials are expected to attend the annual business and professional meeting of the Engineering Institute of Canada, which will be held at the Windsor Hotel, Montreal, on January 27-29. The preliminary work of the convention will be conducted by the retiring president, Lieut.-Col. R. W. Leonard, of St. Catharines. Following the elections, which will take place on the first day, the new president, R. A. Ross, one of the Commissioners of Montreal, will take charge of the proceedings. The first session will be devoted to the discussion of training of engineers, while the second will consider the education of engineers in provincial industries and the activities of the Provincial Government in relation to water problems.

POOR HEALTH FORCES MR. HUMPAGE OUT

General Manager of Wilt Twist Drill, of Canada, Leaving Shortly for the South

Mr. F. R. Humpage, Vice-President and General Manager of the Wilt Twist Drill Co., of Canada, has resigned his position, to take effect March 31st, 1920.

Mr. Humpage has been in ill-health for some time, and felt it necessary to divorce himself, for the time being, from all business activities, and is leaving for Miami, Florida, the latter part of January, where he expects to remain a sufficient length of time to secure entire restoration of health.

Mr. Humpage has been connected with this company for about three and one-half years, during which period of time he has been successful in more than trebling the output and sales of the factory, and has also added new lines to the company's products, among them being that of the manufacture of reamers and milling cutters on a large scale, and more recently the manufacture of a full line of special Ford reamers.

During the three and one-half years, this company has arisen from one of comparative obscurity to that of a leader in its line of business, one indication of that growth being that they are one of the largest users of high-speed steel in Canada.

Mr. Humpage has always taken an active interest in all matters pertaining to manufacturing in Canada, and has been instrumental, and particularly active, in endeavoring to raise the standards of the drill, reamer and cutter manufacturing industries in Canada.

He has always been a strong advocate, and has put into practice the idea of selling the company's products on a cost plus a reasonable profit basis, and also the proper protection of the jobbers, and this, together with the large export business which has been successfully developed during his regime, has been most instrumental in the great development in the company's business which has taken place during that period.

Mr. Humpage has been active in other lines, among them being the development of a cleaning compound, which he expects to place on this market as soon as his health is entirely restored and he is again able to take up active business.

ARE TURNING OUT LOCOMOTIVES NOW

Old Country Firm Has Turned From War to Peace Lines in Short Time

Locomotive Engines.—The vast new locomotive shops that have been equipped and organized at Scotswood-on-Tyne, by Armstrong, Whitworth & Co., are probably as remarkable an example of the change-over from war to peace production as the United Kingdom, or any other country, can show. For many years before the outbreak of war, these Scotswood works had been devoted to the manufacture of armaments. The site, on the banks of the Tyne, is over a mile long, and a large staff of skilled men are making locomotives on orders from many countries, amounting in value to over £3,000,000. It is said that orders have been secured from every country in the world except South Africa.

Not one per cent. of the old machinery, it is stated, has been of any use for the new industry that has thus been founded on the Tyne; and yet, after only eight months of reconstruction work, the shops are approaching full capacity of output, and full capacity will, it is anticipated, be attained next April.

Great interest was taken in the official trials of the first railway engine constructed by Armstrong, Whitworth's, at their Scotswood works during this month. A large company was present when Sir Vincent A. Raven, chief mechanical engineer of the North-Eastern Railway Company, from whose designs the engine was constructed, drove the vehicle through a barrier of national colored ribbons. The new engine is one of fifty that are on order for the North-Eastern Railway Company, and two more are ready to be delivered; then the output will be one per week for three weeks, and eventually it is hoped to produce three each week. The new engine structed for heavy goods traffic, and has 20-inch cylinder, with 26-inch stroke; the hauling capacity is, approximately, 1,000 horse-power; and many special features are embodied in the new engine. All the material parts, such as boiler plates, wheels, frame plates, connecting rods, piston rods, etc., have been made at one or other of the various works of the Elswick Company, at Openshaw, Manchester, or Elswick.

GEOMETRIC

SELF-OPENING DIE HEADS

"YOU CAN'T BEAT 'EM"

It is not the manufacturers of Geometric Self-Opening Die Heads who make this statement, but the users of the tools.
This is the reason that besides being the originators, we are known as the

LARGEST AND BEST KNOWN MANUFACTURERS OF AUTOMATIC THREADING TOOLS

The big question is: Have you applied Geometric Screw Thread Cutting Tools to your threading work?

THE GEOMETRIC TOOL COMPANY
NEW HAVEN CONNECTICUT

Canadian Agents: Williams & Wilson, Ltd., Montreal; The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

PIG IRON TRADE

Selling of basic iron in large quantities is now in evidence. The sale of pig iron for first half is also swelling in volume. Following are reports from various U.S. centres:

PITTSBURGH.—A contract for 30,000 tons of basic, to be delivered 5,000 tons monthly, has been closed by the Crucible Steel Company. The settlement is to be made on the basis of the monthly average of the trade papers. Small tonnages have been sold as high as $40. No. 2 foundry is also selling around $40. Production is increasing, several furnaces having been blown in.

BOSTON.—The market is very strong here, and 2.25 silicon to 2.75 has been sold at $43. The base grade is selling around $41 furnace. Foundries are coming into the market more, and some business for second half has been placed. Enquiries for this period are numerous, two of them being for 10,000 tons.

NEW YORK.—There is a good demand in this market, while tonnage is not very plentiful. The prevailing price is $42 to $42.50 for 1.75 to 2.25 silicon, and $43 to $43.50 for the next grade. Bessemer is around the $40 mark, Eastern Pennsylvania furnace. Some of basic was sold for $39, Eastern Pennsylvania furnace.

PHILADELPHIA.—There have been some big sales of basic during the week, for first and second quarter delivery. The price was approximately $40, delivered, and the total tonnage runs close to 60,000 tons. Foundry iron has sold well, at $42 Eastern Pennsylvania furnace for No. 2 plain, and $43 to $43.50 for No. 2X. There has also been a good demand for malleable, the price ranging from $43 to $43.50, delivered Eastern Pennsylvania.

BUFFALO.—While there is a shortage of iron, opinion is divided between makers as to whether it is an unusual shortage or otherwise. This, of course, causes a difference in quotations. Some furnaces are quoting $38 base price on both first and second half business, while in other cases the second half base price has been jumped to $42.

CLEVELAND.—There is a brisk inquiry developing for last half tonnage, but producers are keeping clear of any large acceptances for this delivery. The quotations are mostly on the basis of $40 furnace for 1.75 to 2.25 silicon.

CHICAGO.—With the market steady at $40 for 1.75 to 2.25 silicon, only small lots are being sold. Local producers are pretty well sold up for first half. Some Southern makers are taking orders, the price being $40 Birmingham for 1.75 to 2.25 silicon.

CINCINNATI.—Furnaces are well sold up, and will not look at second half business. Under these circumstances, the market is merely nominal, although prices are advanced.

ST. LOUIS.—Furnaces are sold up, and the market is at a standstill. Business for second half is not being looked for, and, in fact, in some cases, has been refused. Makers think that prices may be better later on.

U.S. SCRAP METAL

The scrap iron market is showing new strength. Some large purchases of steel have been made, which have stiffened this grade. Following are reports from U.S. point:

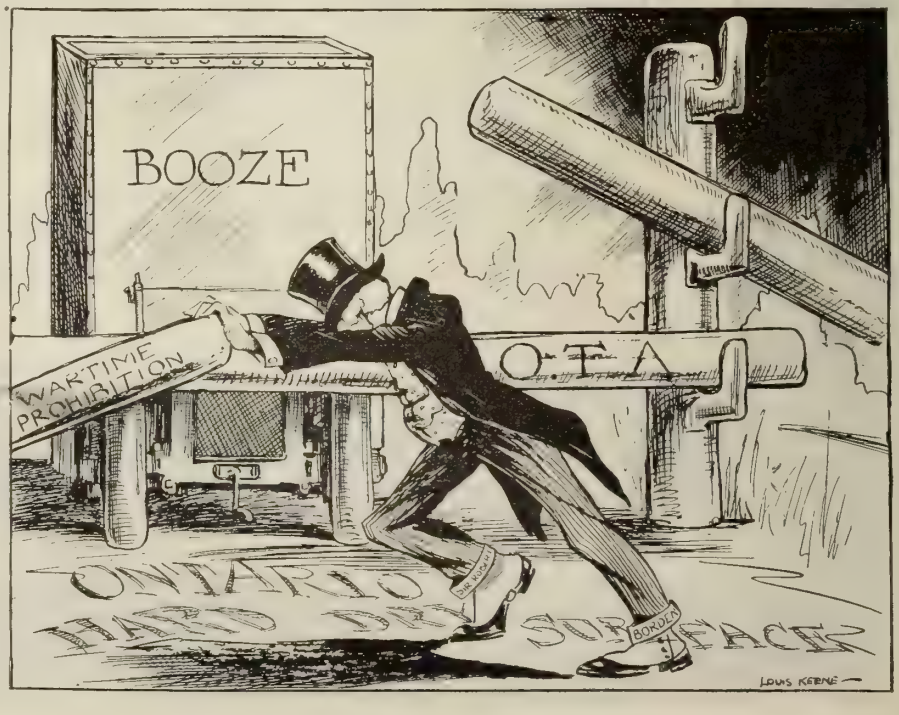
PHILADELPHIA.—There is a brisk market in this district, which is not confined to any one grade. There have been heavy sales of heavy melting, amounting to about 90,000 tons, at a price around $27, delivered. There is a good demand for all grades.

BOSTON.—There is a good demand for cast scrap and steel scrap, and other grades have advanced. No. 2 machinery scrap is now quoted at $32, and in some instances a mixture of No. 1 and No. 2 machinery has brought $35.

PITTSBURGH.—There has been an advance in the price of steel-making scrap, heavy melting having been sold at $27.50, and baled sheets at $24.50. Re-rolling rails are in a firm position, sales having been at better than $36 delivered Newark. Foundry grades are in good demand, but scarce.

NEW YORK.—There is an upward movement in practically every variety of scrap material. The advances are from 50 cents to $1, though heavy cast and machinery cast went up $2. Heavy melting is quoted at $20.

BUFFALO.—There is a good market here for most grades of scrap, and a rising price list. There is still a shortage of cars, but a fair amount of trading marked the week's work. Heavy melting is now at $26, with small available supply.



CLEVELAND.—Good demand, small supply, and rising prices is the story here, as in other districts. Steel scrap which has been selling around $24.50 is now $25 to $26. Malleable has also advanced from $1 to $2 a ton. Cast borings have advanced $1.

CHICAGO.—There is a strong market for scrap material of all kinds, and prices are at high levels. In fact, they are not much short of the figures reached during the war. Railroads are offering about 7,000 tons scrap.

CINCINNATI.—Heavy melting is in great demand, and has advanced in price. Most of the other grades are also figured in the inquiries, and the market is generally very strong.

ST. LOUIS.—There is good demand for nearly every grade, and the available supply is light. Prices have advanced from $1 to $2 a ton. There is not much railroad scrap offering, though the roads have been ordered by the administration to realize on their scrap piles.

A. C. McKenzie has been appointed Engineer Maintenance of Way on the C. P. R., with headquarters at Montreal, succeeding Mr. Frank Lee, transferred.

There is No Universal Panacea for Unrest

Personal Observations of W. R. Basset, President of Miller, Franklin, Basset & Company, of 347 Madison Avenue, New York City

QUACKS want us to believe that there is a magic formula which can be invoked to cure all of the labor diseases in whatever plant or part of the country they may be found. Some have secret processes guaranteed to bathe the face of the erstwhile discontented workman with peaceful, beatific smiles of content.

One demonstrates how pretty five-room cottages with a trellis and a garden hose undoubtedly made self-satisfied, hard-working pillars of society out of I. W. W.'s in a certain town. Another proves that in an Ohio factory the men settled down to a life work of making the boss happy as soon as they were given a voice in the management of the business. And so it goes through the whole list of the cures, whether they be profit-sharing, old age pensions, collective insurance, lunch rooms or baths.

The deuce of it is that every one of these cures have been effective in many plants in bettering the temper of the men. But in many other plants, the same methods have failed miserably.

The trouble is age-old. It is another manifestation of the belief in panaceas, the philosopher's stone, and the fountain of youth. They can't be found.

A pleasant home makes life worth living for self-respecting men, and so conduces to his being better content with his job. But there are a lot of manufacturing concerns which cannot finance such a development. Then there are a lot of foreign-born workmen who will in a week turn a model home into a pig-pen. I know, for I've seen it.

Giving the men more or less of a voice in the management of a business has worked fine in plants where the men really wanted to be happy at their work; where they still retained a wish to be craftsmen. But in a plant where radical teachings have sunk into the men; where the direct-actionist idea of seizing all capital has a hold—the plan is too mild to suit the men. Strongly unionized plants under the dictation of powerful labor leaders are not as a rule to be successfully organized under Industrial Democracy.

Piece rate wage-payment plans are usually successful with a thrifty set of men. But in one plant I recently studied a wage incentive failed to spur workers to an easily obtained maximum earning. This plant was in a small town where the living costs were low. Had it been in a large city where it cost more to live, the workers would undoubtedly have needed more money and might have increased production to get it. As it was, we had to invoke the fear of the fellow-workman's disapproval by means of the group economy bonus.

And so it goes. We have a thousand or so industrial districts in the United States, each with its own living conditions. The workers differ in their ideas, outlook on life, education and nationalities. In some districts the men are largely thrifty; in some not. Some are largely home-owners—capitalists in a small way; some are irresponsible floaters. In some towns there is a preponderance of American born workers with their respect for American ideals of government; elsewhere they are mostly foreigners, here only to get the money and go back.

Here we find most of the men have at least a common school education and read good papers; there they do not speak nor read English but get their information from imported radicals and "reds."

With such wide variations in the type of labor from town to town and between different industries, it should be apparent that the employer's problem is almost an individual one. That makes it out of the question to buy a ready-made "system" which can be put into operation in any plant.

I know of factory owners, in every branch of manufacturing, who have no labor problems. They have without exception studied their workers and devised some method of handling them which fit the peculiar conditions. None of them attempted to buy a patent medicine cure.

Although I'm a disbeliever in "sure cures" there is one thing which I believe would lay a foundation for quieter labor conditions in all industries. That is education in the fundamentals of business economics. It is ignorance of this that makes so many formerly contented men prey to the inflammatory false reasoning of agitators.

The source of wages, for instance, is a mystery to most workmen. They are accustomed to cartoons of a fat capitalist with bulging money bags—from which, presumably, he doles out as little as possible in the way of wages. We know that wages are not paid out of capital but from production—but most workmen don't. If they did, it would be easy to convince them that they can reduce the high cost of living by turning out more work in a day.

Few workmen realize that relatively little capital is in the form of money. They don't stop to think that anyone who saves and buys a house or a piano is a capitalist, and that if capital were confiscated, he would suffer with the other, richer capitalists.

He demands interest from the bank on the savings he puts by for old age—but he forgets that the capitalist who builds the plant he works in is also entitled to interest.

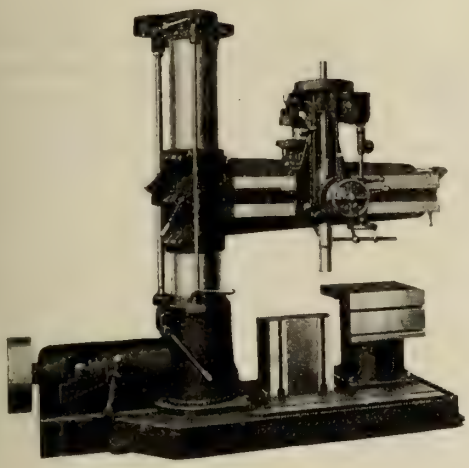
We don't teach these fundamentals of economics in our public schools, and you may be surprised therefore to find that even some of your well-up executives are not well enough informed on these basic principles to offer a better argument to Bolshevik teachings than "Oh bunk!"

The radicals know of this ignorance and work upon it. We should combat their false teachings with true ones.

I have perhaps digressed from my main subject—but I did want to show that there is a need for basic education throughout the whole labor structure.

With this fundamentally sound faundation each employer can then go about getting the co-operation of his men in his own way with a much better chance for success.

He can do this in any way he pleases; but if he is wise, he will be careful about experimenting. If he has time, let him search out another concern in his own line, with surrounding conditions and labor supply the same. If this concern has a plan that has worked well, let him adopt it.



Or he may take advantage of the advice of experts, industrial engineers who have installed methods of every sort in all kinds of plants. The wise employer, however, will not, in blind hope, grab any system which has made good elsewhere, perhaps under entirely different conditions.

Just as employers have different interests and ambitions, so workers differ. Some method can be found which will stimulate them to greater production and to a degree keep them contented with their jobs. But exactly the right method must be chosen.

The production of nitric acid in the United States in 1914, according to the Census of Manufactures, was 78,589 tons of nitric acid of average strength and 112,124 tons of mixed acid. According to other data given in the census, these figures represent about 89,000 tons of 100 per cent. nitric acid. All of this acid was produced from nitrate of soda, consuming about 160,000 tons of nitrate. The pre-war importations of nitrate of soda amounted to about 560,000 tons per annum; hence the normal consumption for purposes other than the manufacture of nitric acid was about 400,000 tons. The present rate of importation is about 1,600,000 tons of nitrate per annum. Since very little is going into storage, and the total consumption for purposes other than nitric acid, manufacture has increased but slightly, if at all, it may be estimated that at least 1,000,000 tons of nitrate per annum are being converted into nitric acid at the present time. This is equivalent to 650,000 tons of 100 per cent. nitric acid, of which nearly five-sixths is being used for the manufacture of military explosives.

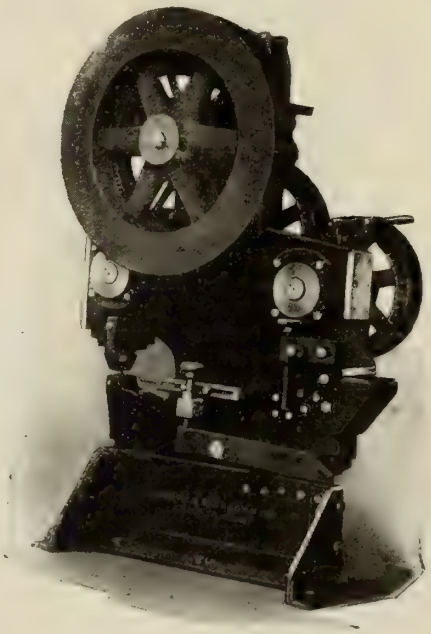
RYERSON

New Machines in Stock

4-Foot Plain Radial Drilling Machines

The Ryerson 4-Foot Plain Radial Drilling Machine is massive and of very rigid construction. The feed is of the positive all geared type and has four changes which can be varied by a conveniently located lever. The tapping, starting and stopping mechanism is operated by a horizontal lever.

Drilling cap. 3½″; Tapping Cap.; 4″ pipe tap; Travel of arm, 34½″; Travel of Head, 40¼″.



Quadruple Combination Punching and Shearing Machine

No. 4 SCAP- Power Driven

The Ryerson Quadruple Combination Punching and Shearing Machine embodies four single tools in one, handling punching, shearing of plates, round and square bars, cutting of angle, and tee iron as well as coping and notching work. All of this can be done without interchanging the attachments for the various operations or having to maintain a number of single machines for each operation.

We can furnish this machine arranged for either belt or motor drive. If direct electric drive is required, the machine is supplied with motor bracket, gear and rawhide pinion.

Punching Cap. ⅝ x ⅝″; Plate Shearing Cap. ½″; Coping Cap. 5″ Sections. Notching Cap. 3 x 3 x ¼″. Bar Shearing Cap. 1¼″ Round Bars, and 1″ Square Bars.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Toronto Harbor Commissioners are calling for tenders, to be received up to February 6, 1920, marked Tenders for Harbor Head Walls. All information can be obtained by application to the Commissioners at the Harbor Commissioners' Building, Toronto.

Restricting Immigration.—Reminders are being sent to shipping companies, calling attention to the order-in-council effective from Dec. 31st last to March 31st, under which any immigrant who is a laborer, mechanic, or artisan, must be in possession of the sum of $250, in addition to their transportation.

Big Contract for Vancouver.—The firm of J. J. Coughlan & Sons have secured from the Dominion Government a subsidy contract for the building of the large drydock at Vancouver, the estimated value of the dock being $3,750,000. The firm will finance the construction, and get a percentage subsidy when the work is completed.

$60,000 for Trucks.—Toronto will shortly spend $50,000 on trucks, if Street Commissioner Wilson gets the authorization he is asking for from the Work Committee. The trucks include tanks for the street cleaning department, trucks for the road oiling section, and also for the refuse collection department.

Miners Sign Agreement.—An agreement has been reached between the Dominion Coal Company and the representatives of the United Mine Workers, and will go into effect as soon as ratified by the local union. The agreement which standardizes wages and grants a general increase, is good for one year, with provision made for revision at stated intervals.

C.P.R. Not to Electrify.—Mr. Grant Hall, vice-president of the C.P.R., made a statement relative to the report that his company had planned to electrify the system. "There is no truth in this report," he said, "either as regards the company or my own alleged opposition to the scheme. The matter is not at present under consideration."

New Coal Operators' Association.—The coal operators in Alberta have split their organization, and a new one has been formed called the Red Deer Valley Coal Operators' Association. Out of 42 members in the original association, 19 resigned, among them being W. R. Wilson, the president. His place has been taken by O. E. S. Whiteman, manager of the International Coal & Coke Company, Coleman, Alta.

New Interests in Canada Car.—New interests have acquired a controlling interest in the Canada Car Co., in a very unassuming manner. Mr. Francis H. Clergue, well known in Canadian financial and industrial circles, bought the stock up on the open market at around 51, and the preferred at a little under par. Mr. Clergue then disposed of one-half his holdings to the new interests.

Briquette Plant Being Pushed.—The briquette manufacturing plant which is being constructed by the Lignite Utilization Board of Canada, at Bienfait, Sask., will be actively proceeded with as soon as the season opens. Some of the machinery contracts have already been let. The capacity of the plant will be 30,000 tons per annum, and production should start in August next.

The Ross Rifle Claim.—Negotiations are proceeding with a view to the settlement of the claim of the Ross Rifle Company against the Federal Government. The claim had been referred to the Exchequer Court, but will now likely be settled outside of Court. The Government offered a sum of $3,000,000 as compensation for the expropriation of the factory, but the company claimed a much larger sum.

Dominion Bridge Statement.—The report of the Dominion Bridge Co.'s working for the past year is considered very satisfactory. The net earnings are $1,343,305, or $522,412 less than last year. The ratios of earnings to common stock are 20.66 per cent. this year, as against 28.7 per cent. last year. In view of the fact that there was no ammunition business, and bridge building and structural work not fully developed, the showing is very good. The usual 8 per cent. dividend was declared, and an amount of $823,305 carried over to profit and loss account. The working capital has been increased by $683,982, and stands at $3,867,406. The profit and loss account has a balance of $3,848,613.

New Brantford Industry.—Announcement was made, following a special trip made to St. Louis by 30 Brantford capitalists, that a plant would be established in Brantford for the manufacture of Bluebird electrical appliances. Local capital to the extent of $200,000 already has been subscribed, and the new company promises to employ 1,500 hands within two years. J. B. Detweiler, general manager of the branch of the Steel Company of Canada in Brantford, will be president of the new company, and will sever his connection with the Canada Steel. The directorate of the Brantford Motor Trucks took the initiative in bringing the new industry to Brantford, and the plant built by the United States Government for munitions will probably be utilized.

New Engineering Firm.—The firm of Clayton, Neil & Jones, with head office in Montreal, and the Toronto branch at 152 Bay street, Toronto, is the latest addition to the engineering industry. The new firm will manufacture all lines of general machinery, and make a specialty of marine auxiliary machinery, including deck winches, steering engines, pumps, etc. Mr. Clayton is very well known to the shipbuilding firms of the country, with whom he has a valuable connection. Mr. Neil, who will look after the manufacturing end, is a practical production engineer of great ability, while Mr. Jones is a specialist on pumping machinery. The firm should have a very prosperous future.

MARINE

Quebec.—The Three Rivers Shipyard Company has received a contract for the construction of six steel vessels, of 7,200 tons. Work is being pushed ahead, and in the early spring it is expected that 3,000 men will be employed.

Cleveland.—Chartering for the opening of navigation has been commenced, half a dozen steel steamers having been placed for grain at 4 cents from head of Lake Superior to Buffalo, and 4¼ cents storage in Chicago and spring delivery in Buffalo.

Montreal. — The Canadian Pacific Ocean Services are to add three steamers to their fleet, and these are being at present constructed in Scotland. They will be called the Montcalm, Matapedia, and Montmorency. They will be of 16,000 tons each, fitted for burning oil fuel, and will be in commission during the latter part of 1920.

Collingwood.—The Canadian Farmer was launched successfully from the

yards of the Collingwood Shipbuilding Company during the Christmas season. The steamer is the fourth one built in this yard for the Canadian Merchant Marine. She will be fitted out during the spring and go down the canals at the opening of navigation.

Victoria, B.C.—The construction of the first demountable ship will be commenced in Seattle very shortly, according to Mr. John Arbuthnot, the originator of the plan. The demountable ship is really a cargo of lumber put together in the form of a ship, and supplied with oil engines and sails, with which the cargo transports itself across the ocean.

Charlottetown, P.E.I.—The loss of the schooner Barbara McDonald was felt very heavily in Prince Edward Island. She was on her maiden voyage and only a few days before she was wrecked her captain was lost overboard. She was the second schooner built on the island recently, the launch of her predecessor, the Victory Chimes, being looked on as the revival of shipbuilding, which once flourished on the island.

Cleveland.—Ice in the Great Lakes caused some damage to belated vessels and caused some of them to be diverted from their destination. The steamer "Stadacona," bound for Buffalo, with grain, was diverted to Port Huron. The B. F. Berry, ordered into winter quarters at St. Ignace, went into the slip without lightering. Some vessels sustained damage to hulls, and one or two lost propeller blades.

Halifax. — Dartmouth, just across the harbor from Halifax, has been chosen as the site for a branch of the Winnisimmet Shipyards, of Chelsea, Mass. The announcement was made by C. N. Delaite and Maxwell Jackson, who have spent the past few days in Nova Scotia looking for a suitable location. W. R. Green, the president of the company, will come to Halifax shortly, to conclude the deal.

Montreal.—The British War Department has turned the former German liner Prince Frederich Wilhelm over to the C.P.O.S., and she will sail from New York shortly to England, to be refitted. She will be placed on the Canadian service when repairs are completed. She was formerly owned by the North German Lloyd, and is of 17,082 tons gross, 590 feet long by 68 feet by 38 feet. She will make the passage from Liverpool to St. John in less than seven days.

St. John, N.B.—The Mayor and Council of St. John have been receiving letters of complaint from owners and agents of steamships which have been compelled to wait in the harbor until a berth could be found for them. One vessel claimed that some perishable freight had been spoiled by cold, due to the vessel having been awaiting a berth for seven days. The harbor commissioner stated there was little chance of the congestion being relieved in the immediate future.

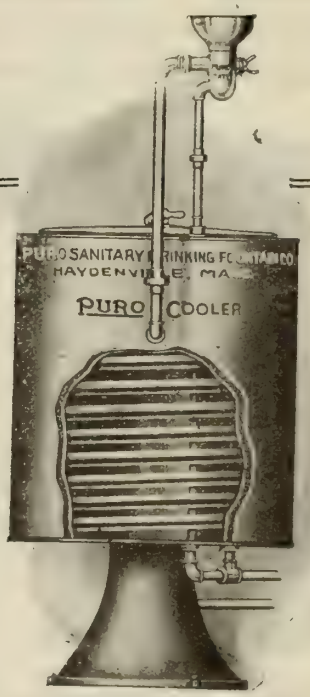
Toronto.—The Dominion Shipbuilding Company successfully launched the full canal-sized freighter, "Torontonian," from their yards recently. The vessel is as sister ship of the "T. L. Church," launched a few weeks ago. The launch was made interesting from the fact that the ice in the bay had to be broken and kept broken by tugs preparatory to the launch. The vessel was christened by Mrs. C. H. Easson, wife of Mr. C. H. Easson, general manager of the Standard Bank of Canada. This makes the ninth vessel to be launched from this yard in the past twelve months. Six of these vessels have been delivered.

A Drinking Water Service that will last a LIFETIME



What you pay for a few ordinary drinking cups will meet the cost of the

PURO SANITARY DRINKING FOUNTAIN
(MADE IN CANADA)

DRINKING CUPS ARE UNSANITARY but the "Puro" delivers clean, fresh water at a reduction of 15% to 35% in water bill. "PURO" WILL SAFEGUARD THE HEALTH OF YOUR EMPLOYEES and protect your staff against disorganization by sickness.
Easily attached. Simply unscrew the ordinary faucet and put on the "Puro." Write us to-day for full information regarding the cost of installation of the "PURO" Sanitary Drinking Fountain Service.

The LYMAN LINE
of Industrial Equipment includes

The Napier
Metal-Cutting Machine

Continuous Cutting

The Napier band cuts all the time—no back stroke—and every tooth does its share.

Saves Time

The Napier Metal Cutting Machine will do more cutting than any other three power hack saws.

Saves Metal

The Napier band's kerf does not exceed .049". This means several dollars a cut in some metals.

Cuts True

The roller guides, close to both sides of the work, hold the inch-wide Napier blade so true that the Napier Metal-cutting Machine can well be considered a precision tool.

More and Better Work

—at lower cost—is what users are getting from Napier Metal-cutting Machines. Does this interest you?

Shelby Seamless Steel Tubing

Material

Made regularly from steel containing .15% to .20 carbon, and also from steel containing up to .55 carbon, and from 3½" nickel steel.

Sizes

Shelby Seamless Steel Tubing is cold drawn in sizes from ⅛" O.D., to 9" I.D., and hot drawn, in sizes up to 20" O.D., or larger on special orders. Wall thickness covers a wide range for each size O.D. In our Montreal warehouse we have now

Over 400 Sizes in STOCK

Anneals

Shelby Tubing is stocked in Finish Anneal, which is best suited for general work. It can also be supplied very soft, or unannealed, if required.

Uses

Shelby Seamless Steel Tubing is being used in more than a thousand ways in up-to-date shops. It saves time, lowers production costs, improves the product—and PAYS. We have

A New Booklet

—giving detailed information on Shelby Tubing, and suggesting many ways of using it. Would you like a copy?

You're Next!

The Board of Commerce attacked the Packers, and there was, on the whole, general rejoicing. The Packers were few—those who enjoy bacon many. Doubtless many—in ignorance of the facts—thought the Packers were "gouging."

Then one of the Commissioners criticized the farmers. It was a false step—a skid which he has probably lamented and has endeavored to repair, for it has lost him much popularity.

Now the Board of Commerce is setting prices for the retailer. It has dealt with some grocery lines—with clothing.

THE FINANCIAL POST brings out the dangers of the Board of Commerce's course. Dealing with this price fixing, THE POST'S expert writes:

> "For instance, the percentage of profit on bacon and boned ham is set at 20 per cent. The merchant naturally asks on what basis he is to reckon his 20 per cent., and there is nothing in the published report of the ruling to assist him. Does it mean 20 per cent. on the price he actually pays for the goods? That is probably the viewpoint that any court would take of the matter, yet as every sound merchant knows, 20 per cent. on a buying price is just 16 2-3 per cent. of the selling price, and it is only the profit on the selling price that represents the actual profit to the merchant.
>
> "The lowest cost of business for such retail stores is between 18 and 21 per cent., according to the class of business done. Take the cost of doing business at the modest average of 19 per cent. and on bacon selling for 60 cents a pound the retailer on the basis of profit outlined above loses 1 4-5 cents on every pound of bacon sold. If he slices the bacon he is permitted to take 2 cents a pound more; that would seem almost to let him out even.
>
> "There is, however, the large element of waste to be considered here; the ends of the ham or bacon must, of necessity, be a complete loss, which the merchant who slices his bacon has himself to meet. That the two cents per pound margin is pitifully small to cover these items of loss is illustrated by the fact that the New York City fair price list sets the margin for slicing bacon at 5 cents a pound, believing that it requires that amount to cover the element of loss in the process."

If you are a grocer or a clothing merchant you want to follow the actions of this Board—to have the clear light of understanding brought home as THE POST brings it home. If you haven't been touched yet—well, **"You're Next"** and equally you require to be informed.

To this end subscribe for this business man's paper—

THE FINANCIAL POST

For its wide information on business—for its news on financial matters, but perhaps most of all for its sane, balanced viewpoint THE POST has value for you.

THE FINANCIAL POST dares to stand out against any popular, but unsound movement or action. Those who appreciate courage and conviction appreciate THE POST whether they always agree with it or not.

Make sure of THE FINANCIAL POST for 1920 now by filling in and returning this coupon.

Sturtevant
(TRADE MARK)

MONOGRAM BLOWERS

Aid Manufacturing Processes

—in a thousand ways. They are adapted to ventilating rooms, exhausting chemical and acid fumes, drying, supplying air to forges and furnaces; in fact, any industrial problem where large volumes of air are required. Constructed like a battleship —they stand wear and tear, which many applications require. We carry a large stock and can ship without delay. Call upon any one of our twenty-three Branch Offices to help solve your problem. Bulletin 242-H gives a comprehensive idea of these blowers. Asking for a copy involves no obligation.

B. F. STURTEVANT COMPANY

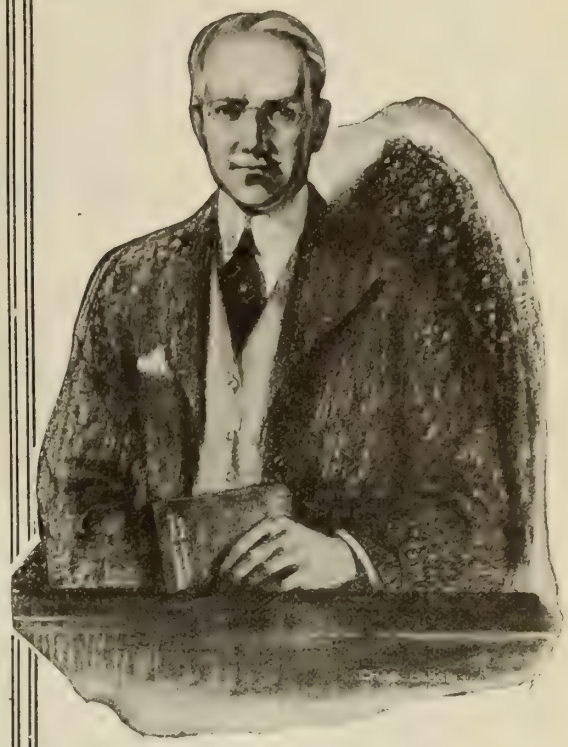
The owner says



"There's something about a Starrett Tool that appeals to a good mechanic. I mean something beyond their reputation for accuracy. Take a Starrett 'mike,' for instance. It *feels* as though it was made by a man who knew what he was doing.

"Starrett Tools and good mechanics seem to go together. I don't know whether it's the tools that make the mechanics or the other way around, but I do know that when I see a man with a good kit of Starrett Tools I feel that there's a chap that shows that he appreciates good work. It sort of leads me to expect that the work he does will be as good as the tools he uses.

"I suppose that pretty nearly every tool manufacturer in the country has got some of his tools in this shop, but I've noticed, especially among the toolmakers and expert machinists, that there seem to be more Starrett Tools used than all the other makes put together.

"What? Of course any of the tools we buy ourselves are Starretts, wherever it's possible. When I was a machinist I bought Starrett Tools for my own use and I believe in giving my men as good tools to work with as I would use myself."

Starrett Tools

42-10

The L. S. STARRETT COMPANY

THE WORLD'S GREATEST TOOLMAKERS

Manufacturers of Hack Saws Unexcelled

ATHOL, MASS.

For thirty-nine years Starrett Tools have made it easier for machinists to do good work. Write for Catalog No. 21 "3"

Announcement !!

MORROWS AT INGERSOLL

The pioneers at Twist Drill making in Canada, who always made—not cheap drills—but *good drills,* have now perfected something better, *High Speed Twist Drills of really wonderful performance.*

A demonstrator—an expert on Drill Tempering—will go into your plant if desired to show you, without cost to you, what these *Morrow High Speed Twist Drills will do.* If you are trying for maximum production on difficult work, write us at once.

If these Morrow High Speed Drills will do for you what they are doing in some of the large auto manufacturing plants *then* you want them.

Morrow High Speed Drills will positively give you *more holes* with less re-grinding than you can get with other makes.

ELK BRANDS FIRE BRICKS

A Brand for every purpose ensures the best results.

Each brand of Elk Fire Brick has some particular qualification which fits it to give better results in certain places than other brands we produce. It differs from the others either in grind, mixture of clays, or in method of manufacture, or possibly in chemical composition.

A trial will convince you that both our quality and service equal the best.

Large stocks of various shapes carried in warehouse in Hamilton.

THE MASTER METAL

STELLITE

Not Steel—but its master

Stellite — an extraordinary metal that gets harder and tougher the hotter it becomes, a cutting tool that cuts better and better up to a temperature of 1800° F.

It is a combination of alloys that is harder, tougher and more lasting than the best of high speed steels.

A Stellite tool has a production limited only by the capacity of the modern lathe. A tool that speeds up production, eliminates vexations, delays, cuts costs and gets the job done.

At the end of five years' trial in shops of all sizes throughout America, Stellite is in wide use and in better repute than at any time in its history.

The story of Stellite will interest you. A copy is yours on request.

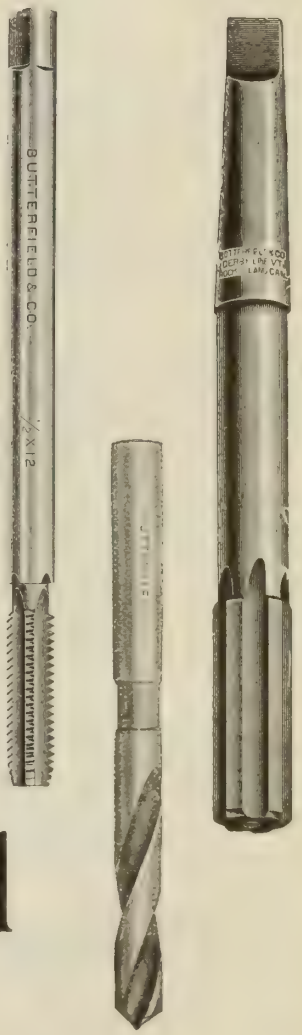
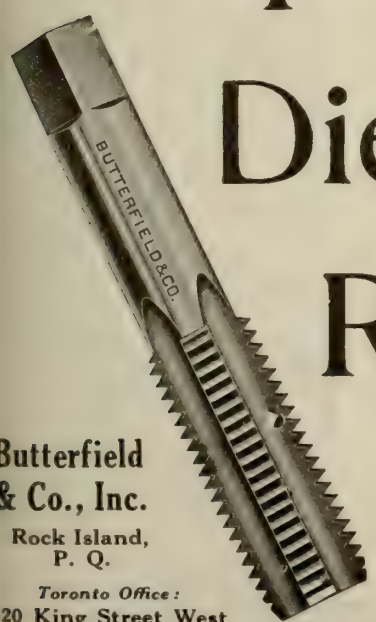
You're not merely buying tools—



You're buying SERVICE when you order



BUTTERFIELD Quality

Supply your mechanics with Butterfield Tools.

When a skilled mechanic looks on the shank of a tool and sees the name "Butterfield," he knows, from past experience, that he has been provided with a tool that will be equal to the most exacting work. You'll be money ahead in the long run by giving them quality tools. A trial is convincing.

SERVICE - SALES
High-Grade Machine Tools

THE primary object of this Company is to make money—through specialization in the sale of a restricted number of lines of high grade machine tools.

It is our belief that our sales can be built up by an honest, striving to render genuine service to our customers, and by the confining of these sales to machine tools only.

It is our hope that our success will be coincident with the establishing of a great many mutually profitable friendships for our Company which will in turn serve to bring into closer harmony our Principals and our Customers.

OUR whole aim will be to so conduct our business through efficient service and fair dealing as to thoroughly maintain the established prestige of the lines we represent.

HENDEY

18-INCH GEARED HEAD LATHE

8 mechanical changes of speed for spindle with driving shaft running at constant speed, 4 direct and 4 through back gears.

36 DIFFERENT THREADS AND FEEDS are had through Mounted Change Gearing, each change being quickly made through controlling handles in Gear boxes.

BEFORE PURCHASING A NEW LATHE INVESTIGATE THE HENDEY SERVICE.

We'll help you by furnishing list of users.

Write for descriptive circular.

IMPROVED CENTERING MACHINE

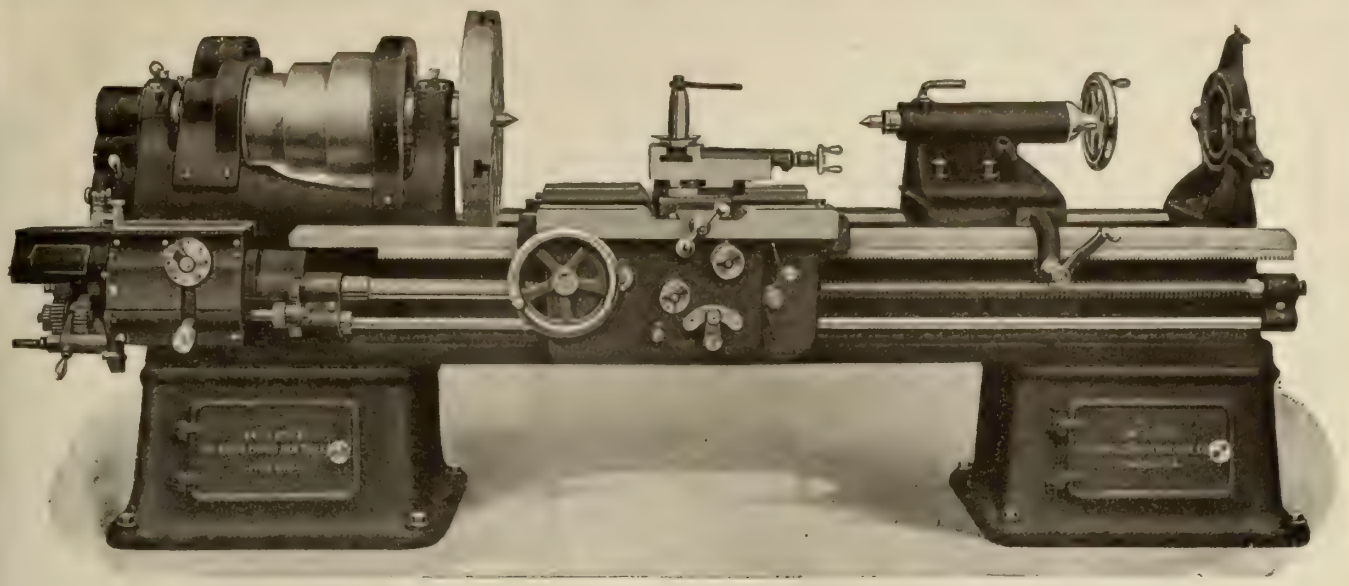
Hendey centering machine on centering work in plant of Can. General Electric Co. on all sorts of portions of their product.

Assures perfect results at low cost. The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost. Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers; front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground.

Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.



Capacity of machine is from 5-16 to 4 inches inclusive.

LET US SEND OUR CIRCULAR

Canadian Machinery and Manufacturing News, January 29th, 1920. Vol. 23, No. 5. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

Mr. Manufacturer!

The City of

ST. JOHNS,

QUEBEC

Is an exceptionally good industrial location

Read These Facts:—

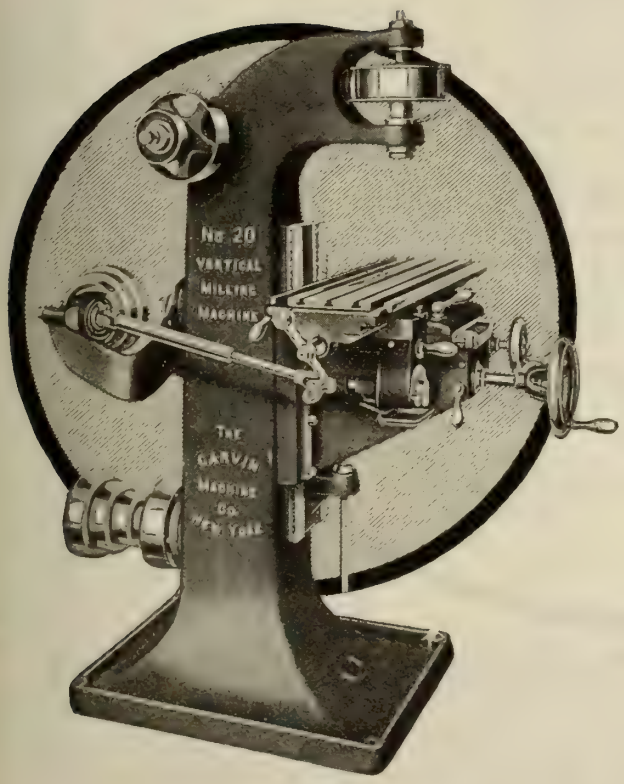
ST. JOHNS POSSESSES EXCEPTIONAL TRANSPORTATION FACILITIES from the source of raw material to the distributing centres for the finished product. On the main lines of the Grand Trunk, Canadian Pacific and Intercolonial Railways; connected with all Eastern U.S. railways; direct connection with docks at Montreal; connected by the Richelieu River with New York, the St. Lawrence River, the Great Lakes. All railways connected by a terminal switching system with very low charges. No custom delays at St. Johns.

THE CHEAPEST LABOR CENTRE IN THE COUNTRY. Skilled and semi-skilled labor, both male and female, is plentiful. Labor is unorganized and there is a remarkably low cost of living. Strikes and labor troubles unknown.

Inducements to New Industries are Unparalleled

Fifteen years' tax exemption with period subject to extension; all public improvements required, such as streets, sidewalks, waterworks, sewers. Also a bonus to you of five per cent. on your pay-roll for five years. If you desire it, the city will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

For more specific information write to



The Secretary of the City Council

St. Johns, Quebec, Canada

GARVIN MACHINE TOOLS

You can profitably employ the Garvin Vertical Miller

In its operation you have all the time saving advantages of the vertical machine for spotting-off bosses, face milling, die sinking, milling out recesses and T slots, finishing circular slots and edges and general milling work. You can handle the work quickly, conveniently and complete such operations at minimum cost.

And in obtaining these advantages you sacrifice none of the rigidity and vibrationless operation which are an absolute requirement, if you are to be permanently satisfied. The design of this machine admits of its running at high speeds and you can have it complete with motor drive if desired. It is built right and is good for years of efficient service.

There are other equally worthy Garvin profilers; cam-cutters, die slotters, tapping machines, gang drill presses, etc., about which you will wish to know.

May we send you the 340-page Garvin Catalogue? It's full of valuable information.

The Garvin Machine Company

Spring and Varick Streets

NEW YORK, U.S.A.

GARVIN

BUILDER OF BETTER MACHINE TOOLS

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the wide-spread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and will soon be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″, ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14″ wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:

ANGLES—Equal Leg—
6 x 6″—5 x 5″—4 x 4″
3½ x 3½″—3 x 3″
2½ x 2½″—2¼ x 2¼″
2 x 2″—1¾ x 1¾″
1½ x 1½″ 1¼ x 1¼″

ANGLES—Unequal Leg—
6 x 4″—6 x 3½″—5 x 4″
5 x 3½″ 5 x 3″ 4½ x 3″.
4 x 3½″ 4 x 3″ 3½ x 3″
3½ x 2½″ 3 x 2½″ 3 x 2″
2½ x 2″.

BEAMS—
15″, 12″, 10″, 8″, 6″, 5″, 4″, 3″.

CHANNELS—
15″, 13″, 12″, 10″, 8″, 6″, 5″, 4″, 3″

ZEES—
3¼ x 3 x 3¼ x 5/16″
3 5/16 x 3 1/16 x 3 5/16 x ⅜″.
3⅜ x 5⅛ x 3⅜ x 7/16″
3 1/16 x 4 x 3 1/16 x ¼″
3⅛ x 4 1/16 x 3⅛″ x 5/16″
3 3/16 x 4⅛ x 3 3/16 x ⅜″.
2 11/16 x 3 x 2 11/16 x ¼″
2¾ x 3 1/16 x 2¾ x 5/16″

ROUNDS—
All sizes from ½″ up to and including 4″.

SQUARES—
All sizes from ½″ up to and including 3″.

FLATS—
All sizes from 1 to ¼″ up to and including 14″ wide.

MINE RAILS—

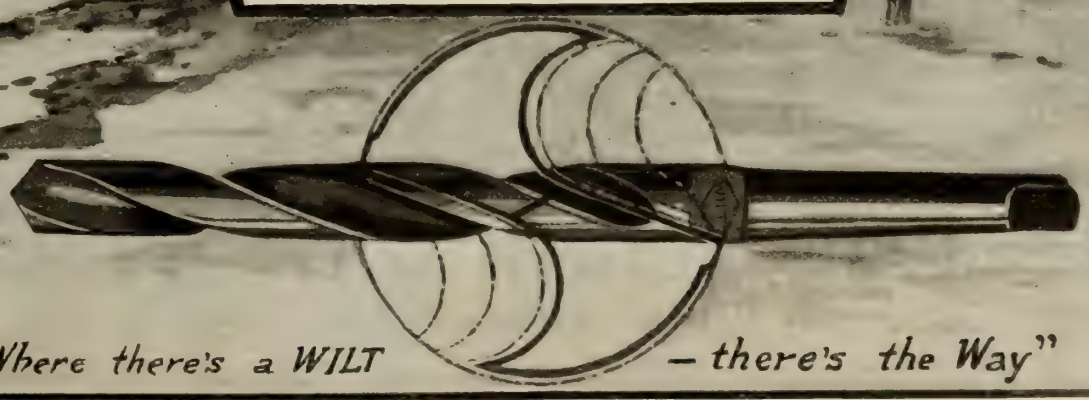
WILT

HIGH SPEED AND CARBON TWIST DRILLS

REAMERS AND MILLING CUTTERS

Quality First

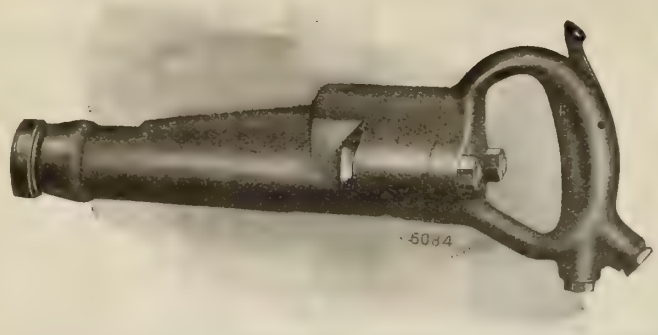
The Keystone Upon Which All WILT Products Are Built



A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters.** **WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

Put Them to the Test

WILT TWIST DRILL COMPANY



OF CANADA, LTD. WALKERVILLE, ONT.

London Office: Wilt Twist Drill Agency, Moorgate Hall, Finsbury Pavement, London, E.C. 2, England.

"LITTLE DAVID"

Riveting Hammers

The control of the "Little David" is very sensitive and ranges from a light tap to a heavy crushing blow as the operator desires. Good balance reduces vibration to a minimum and the sand-blast finish makes the tool easy to hold.

Embodied in all "Little David" Air Hammers is a one-piece combination piston and poppet type throttle valve retaining all the nicety of control of the former type and the freedom from leakage which characterizes valves of the poppet type. The valve closes against a beveled seat which will remain tight for the entire life of the tool. The trigger spring is made in one piece from a special grade of steel and has a long bearing and ample support within the handle, eliminating the danger of breakage and enabling the tool to stand up under abuse.

Our nearest branch will tell you more about these and other "Made-in-Canada" pneumatic tools.

THE JOHNSON FRICTION CLUTCH

SINGLE CLUTCH EXTERIOR

THE SIMPLEST WAY—AND THE BEST

In a clutch or any other mechanical device, unnecessary complication means trouble. Make a single part serve where two have been used before, and you have reduced by one-half the places that can break, wear or get out of adjustment. Put the cost of **extra** material into **better** material, and you have doubled the length of service.
In the Johnson clutch, this idea has been followed out to its practical limits. The result is a model of simplicity in clutch construction—a few sturdy parts, each correctly built and accurately tested for the duty it must perform. This lack of complication means continuous service and low maintenance cost. Johnson Friction Clutches stay on the job.

Oxy-Acetylene Welding and Cutting

Rapid Repairing "On the Spot"

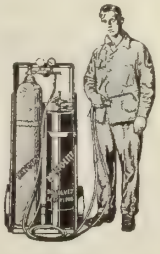
This illustration shows an operator repairing a leaky tank car right on the track, at a trifling expense, by the Prest-O-Lite Process of Oxy-Acetylene Welding. Railroads, Mines, Factories and Machine Shops everywhere have adopted this process, and are saving hundreds of thousands of dollars annually.

Costly tie-ups are avoided—valuable castings and machine parts are saved from the scrap pile—and many economies and improvements are effected both in repairing and manufacturing.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones.

Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.



Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

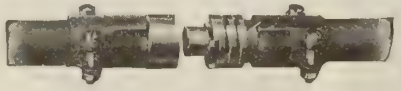
Cleveland Sand Rammers
FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS



For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

The Driller for Exact Work

HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

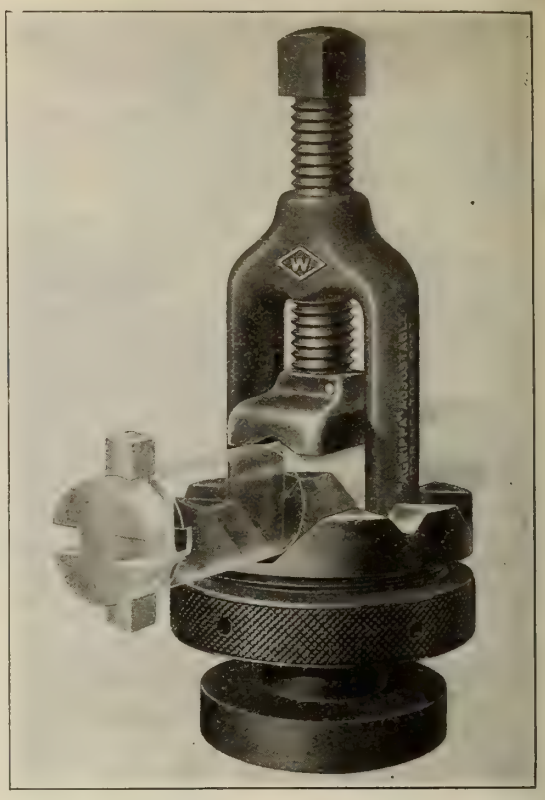
Why use makeshifts?

WHY waste time and energy with makeshift devices for boring operations when Williams' "Agrippa" Adjustable Boring-Tool Posts offer convenience and efficiency developed to the *n*th power.



Each Post accommodates a wide range of Bars, the height of which is readily adjusted; a turn of the Knurled Ring, raises or lowers the base on which they rest. The whole device is instantly and rigidly locked by tightening the Set Screw.

Four sizes for ½" to 2¼" diameter Bars—furnished with or without Bars.

Ask for Machinists' Tools Booklet.

"Keystone Quality" Will Still be There After Long Use Has Worn Away The Name

We like to think of that.

We like to think that the reputation of Keystone Tools is built upon a foundation of service with **Quality** the Keystone rather than a copyrighted name. For it is conceivable that imitators, or even the whims of courts, might rob us of our copyrighted name. But who could take "Keystone Quality" from Keystone Tools?

Write for name of nearest dealer.

The Keystone Mfg. Company

Buffalo, N.Y., U.S.A.

Don't Try to Cut too Fast

Hack Saws, like men, can work only about so fast and be efficient.

Trying to cut the cost per cut by simply running the saw faster almost invariably results in just the opposite. Excess speed with a hack saw heats the blade and draws the temper. The likelihood of the teeth dragging on the return stroke is increased and if the teeth strike a soft spot in the work, and "dig in," they're almost sure to strip.

To cut down the cost of your hack saw work, select a good make of saw—most machinists prefer Starrett blades. Be sure that you are using the right blade for the particular work you have to do. Regulate your weight properly, flood the work with lubricant, and most of your troubles will vanish.

The Starrett Hack Saw Chart saves a lot of time and trouble wherever it's used. If you haven't a copy, your dealer will supply you or a copy will be mailed on request.

Ask for Catalog No. 21 "3" also.

Here's Pinion Shaft Grinding On a Norton

This photograph was made in one of the well-known automobile factories, and shows just how Pinion Shafts for a well-known truck are being produced. In the rough these shafts have a diameter of about 1¼ in.; from .018 in. to .020 in. of stock is removed, the operator being allowed a tolerance of .0015 in. and the output is approximately 200 daily. The machine shown here has been in constant use over 8 years, has required hardly any repairs, and has always given splendid satisfaction.

This is fairly good grinding, but no better than you should obtain. Compare your results and if you are in need of additional information, write to us. We'll be glad to help you.

Vol. XXIII., No. 5 January 29, 1920

Interchangeability as an aid to Greater Production

The Need of Accurate Production in Any Line of Industry is Too Well Known to Require Comment. Herein Are Shown and Described Various Precision Tools Used to Obtain Such Results.

By J. H. MOORE

THERE was a period when the term production did not mean so much in the mechanical world as it implies to-day. Manufacturers had very little competition to deal with, never stretching themselves to produce an article in the shortest time possible, nor attempting to secure interchangeability. In fact the latter-mentioned word had an ugly sound to them, forecasting all sorts of difficulties and pitfalls.

Take for example the case of many makes of the earlier models of the Linotype. The feature of interchangeability was largely conspicuous by its absence in this case, and considerable trouble and irritation resulted from this fact.

A machine of such nature, consisting as it does of some 3,600 odd parts, is bound to get out of order to some extent. A break occurs and a new piece is required at once. Providing that all parts are interchangeable, the problem is a small one, but in those old days, when very few parts were a duplicate of each other, the fun (?) encountered was sometimes great. It was necessary to file this, grind that, and so on.

It was only natural that such a condition had to change, and change it did, for to-day this type of machine, of which there are numerous makes, is so improved, that all parts are absolutely interchangeable. In the event of a breakdown out comes the broken portion and in goes a new piece, a perfect fit, without any trouble.

How has such a sweeping change become possible? Simply through forethought, together with careful planning of jigs and fixtures, test gauges, etc. All this did not happen in a day, but has been the result of steady improvement as time went on. What holds good in the story of the Linotype, likewise applies to the use of production and inspection tools in the machine tool industry.

The writer can well remember the time when jigs and fixtures were looked upon as, well, a sort of wild dream on the part of an efficiency expert, and as for the fellow who carried a first-class set of tools in his kit, why, he was considered crazy. The idea of spending his own money to produce better work for the company was always a subject for a joke.

To-day the opposite condition holds good, for the chap who works with old-fashioned tools is out of date, a back number, and not to be classed with the other type of workman who delights in keeping his tool kit up to the minute.

From this statement it is not to be inferred that good tools make good workmen. Far from it, for we have seen a mighty poor workman handling good tools. We have also seen cases of a good workman using poor tools, with poor results, who could have obtained the best of results with the proper equipment, but in the latter case the workman soon got wise to himself.

All these facts, however, are already history, so why repeat them? Let us proceed into a talk on production and inspection of tools, taking it for granted that all readers agree with us as to the feasibility and advantage of their use.

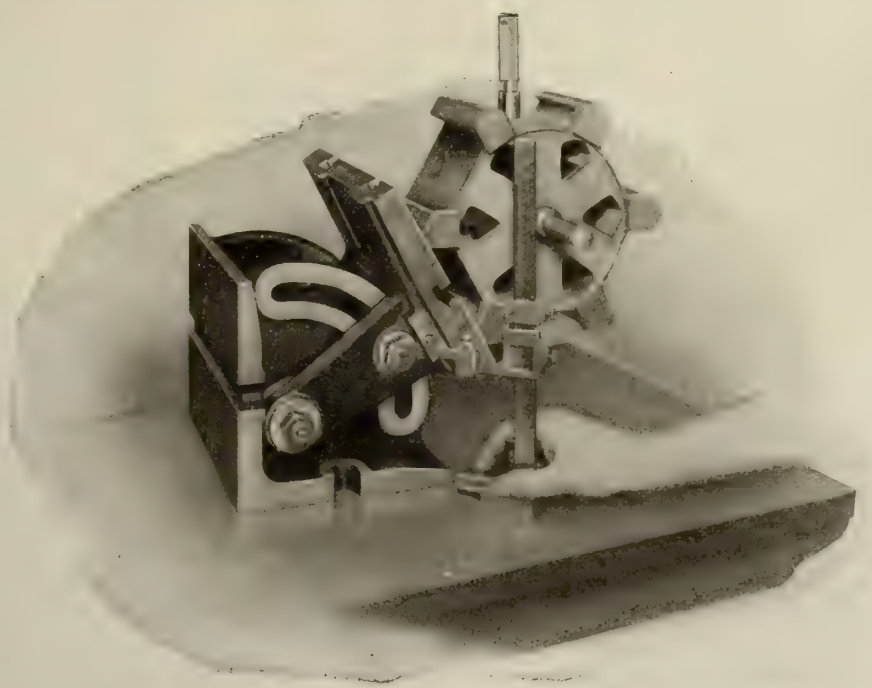

FIG. 1—ILLUSTRATING THE USEFULNESS OF THE ADJUSTABLE KNEE IN SETTING UP TO CHECK MEASUREMENTS.

To confine oneself to any particular branch of industry would be impossible, but of one thing we can speak, and that is the fact that the real problem in any manufacturing process is the designing and building of special tools, jigs, fixtures and gauges necessary for the economical production of the product no matter what it may be, making sure that all parts are interchangeable.

Of course we are taking it for granted that the product is to be turned out in reasonable quantities, for the fact of quantity enters largely into the problem of how much should be expended on fixtures, gauges, etc. A concern like the Ford Motor Car Co. can afford (no pun

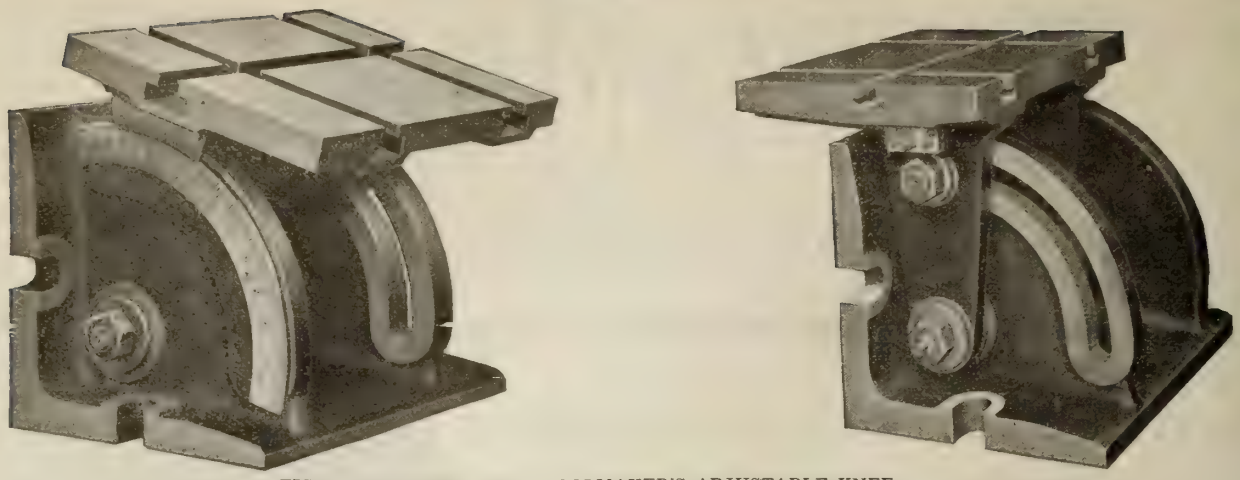

FIG. 2—TWO VIEWS OF A TOOLMAKER'S ADJUSTABLE KNEE.

intended) to spend considerable money on a special speeding-up fixture, for their production is so great, while a manufacturer turning out say only 5,000 machines a year could not attempt to equip his plant in a manner similar to the first-mentioned concern. In other words the planning of equipment expense is largely dependent on the quantity produced.

Usually the first germ of the idea is created in the drawing office. This is especially true in the case of a jig or fixture. The idea is thrashed out thoroughly, until it is at last O.K.'d, traced, blueprinted, and passed on to the tool room.

The Need of Good Tools

We will suppose the fixture designed is to be used on the lathe, the operation being the turning of the taper portion on an automobile brake rod support. The taper on such a piece is about 3 inches long, and all pieces must be exact duplicates of each other.

In order to make sure that all dimensions on the turning fixture are accurate, the toolmaker should be equipped with only the best of precision tools. Take for example Fig. 1. While this illustration does not depict a fixture of the nature we speak of, it does show clearly a good example where the adjustable knee, or swivel angle block (as it is sometimes called) can be used to advantage.

By the use of this production tool you can clamp a fixture securely, marking such measurements as you see fit, or checking dimensions, as the case may be, feeling assured that the results obtained will be accurate in every respect, providing of course you exercise reasonable care and use a good grade of measuring tool.

Fig. 2 gives two different views of this style of adjustable knee under discussion. As can be noted, it can be set to any desired angle. Sine buttons with sufficient centre distance for obtaining angles accurately, are set in one end of the knee. At the other end is a graduated section and vernier, reading to 5 minutes, which enables the knee to be set quickly to within 5 minutes of the required angle.

The working faces of the knee are provided with T slots for bolting the work to the tilting table.

Usually the height of this type of knee is 9 inches when in horizontal position, which is ample height to allow the handling of quite a variety of work. Wherever accurate tool or fixture work is being performed, a knee of this nature not only speeds up the work but helps to ensure its being correct.

The Testing of the Taper

Let us suppose the piece already mentioned is completed, all but the inspection test. In order to test the accuracy of the taper we must first have a suitable gauge for the purpose.

At Fig. 3 is illustrated a gauge of such a nature, while at Fig. 4 is shown the tool in actual use.

Such a gauge as illustrated is well adapted for use in connection with the economical reproduction of any taper within its limits. It is made up of two adjustable straight edges mounted on a cast iron body, with a convenient handle on one side by which the gauge may be held or clamped when in use. Of course, as can be understood, various sizes of this tool are made, the sizes of the test blades varying in length.

The Measuring of Angles

In the making of taper test plugs and other work of like nature it is essential that the toolmaker have some means of accurately testing his angles. For this purpose a sine bar fixture as shown in Fig. 5 is often used. Any part can be accurately laid out, made and inspected with the aid of this type of fixture. Pieces with several measurements can often be checked with one set up on the sine bar. Standard or special tapers can be accurately made, both cylindrical and flat. The bar illustrated is what is known as the improved type, and has a clamping device by which the pivot stud can be clamped at any height, independent of the clamping arrangement of the bar. Such an advantage is no doubt obvious to every reader so we make no further comment on this feature.

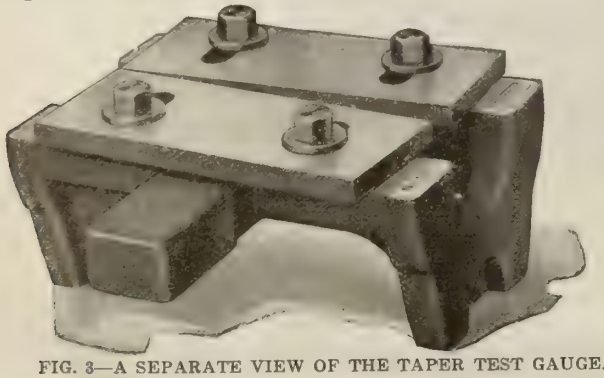

FIG. 3—A SEPARATE VIEW OF THE TAPER TEST GAUGE.

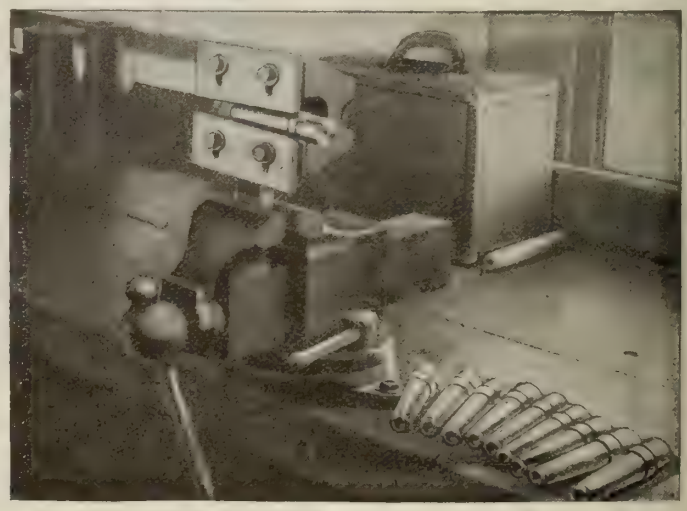

FIG. 4—IN THE ILLUSTRATION SHOWN THE GAUGE IS BEING USED FOR DUPLICATING TAPER SHANKS ON CUTTER BLANKS.

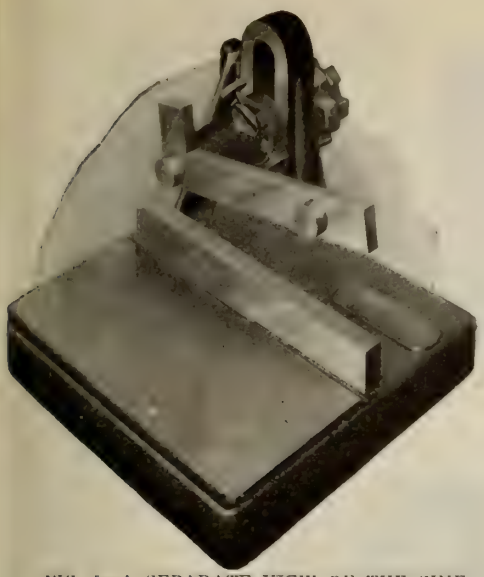

FIG. 5—A SEPARATE VIEW OF THE SINE BAR FIXTURE.

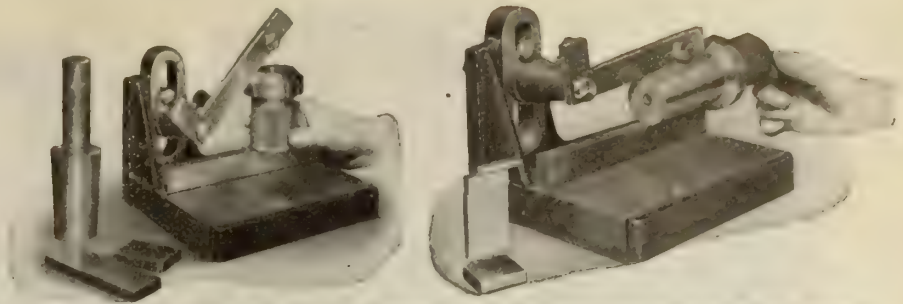

FIG. 6—USING THE SINE BAR FIXTURE FOR TWO DIFFERENT STYLES OF WORK.

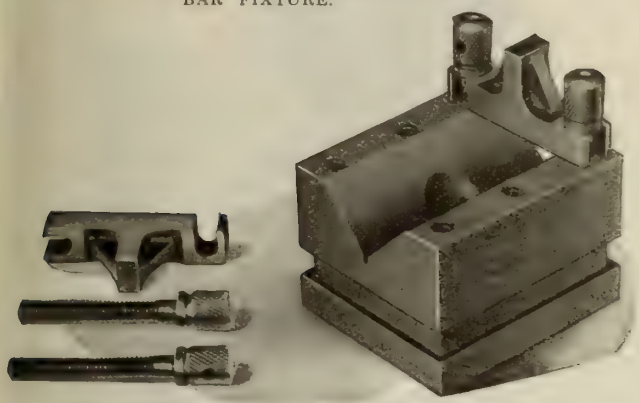

FIG. 7—ONE STYLE OF "V" BLOCK OFTEN USED.

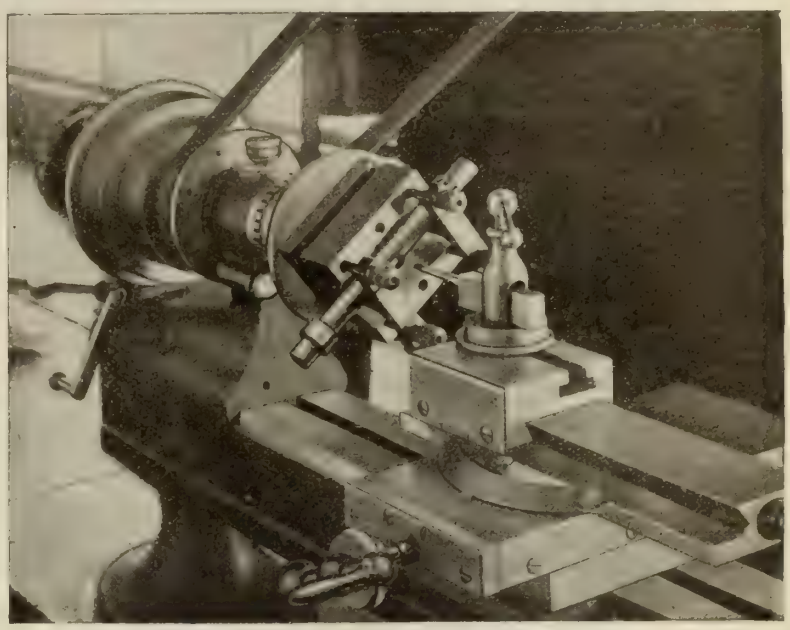

FIG. 8—USING THE "V" BLOCK AS A MEANS OF BORING A HOLE ACCURATELY THROUGH A STUD.

To illustrate how such a bar is used, let us refer to Fig. 6. Here we see two different set-ups and steps in the measurement of a taper test plug. The illustrations are so clear in themselves that it is hardly necessary for us to go into details.

The Use of the V-Block

The V-block and its uses are not as familiar to the average mechanic or toolmaker as they should be. Of course there are innumerable styles of blocks, from the common garden variety to the finer finished article.

As readers are no doubt familiar with the regular type used we will not touch on that style, but confine our attention to what is known as the universal type. Fig. 7 illustrates the appearance of such a block. It will be noted that this block is provided with a hole, central with the V, by means of which it can be quickly and accurately set with the V, central with a spindle or to some other required position.

By using a block of this nature the usual tedious task of lining up the V-block on a face-plate is avoided, for it is a simple matter to indicate the hole and adjust it until it runs true. The hole also provides a clearance space for the drill or boring tool as the case may be. The clamping holes (which can be clearly noted on the illustration) go entirely through the block and are used by inserting screws from the back. A clamping groove is also provided in each side of the block.

Fig. 8 shows one of these blocks set up for the boring of a hole through a stud. In precision work it is essential that any hole bored through a stud must be absolutely accurate. It is in cases such as this that V-blocks prove their usefulness.

Of course we would not have readers imagine that V-blocks are only used to bore holes through studs. This is not

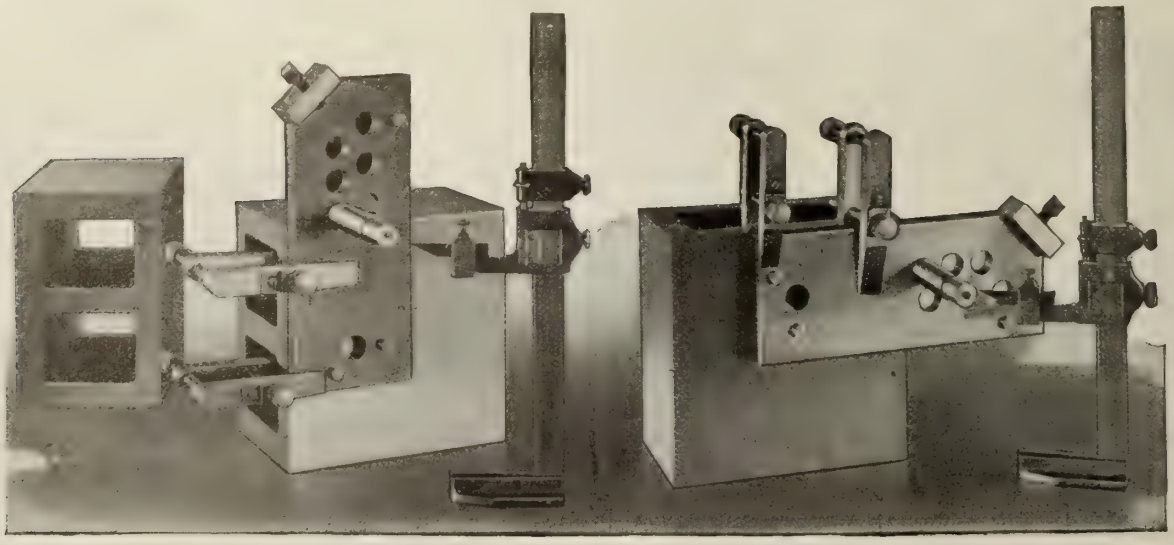

FIG. 12—SHOWING HOW BOX PARALLELS ARE USED.

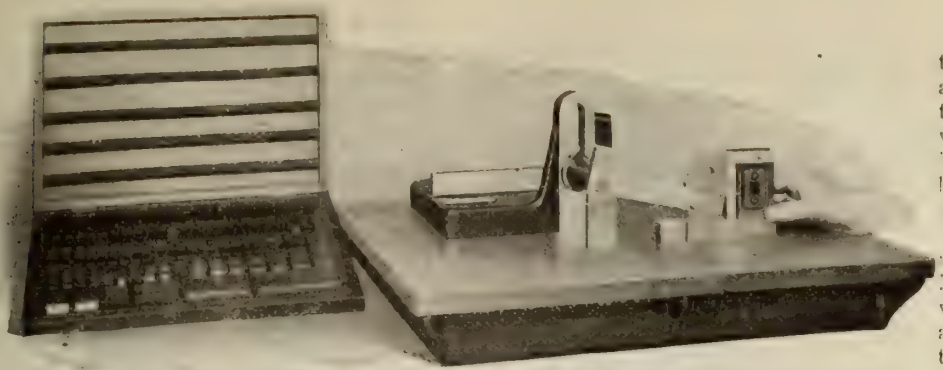

FIG. 16—USING THE UNIVERSAL SQUARE TO SET THE SINE BAR FIXTURE, FOR A SPECIAL MEASUREMENT.

our intention, for our idea is to point out the advantage of using a V-block, in conjunction with the lathe, whenever practical.

The Use of Equalizing Jaws

It often happens that equalizing jaws can be used to good advantage throughout the tool room. This is especially true if the piece to be gripped is of peculiar shape. At Fig. 9 we illustrate a pair of these jaws.

Jaws of such nature are often found equally useful for the general machine shop as well as the tool room, but in this particular case we will confine ourselves to the tool room. Time in set-ups is saved by the use of such a tool, not to speak of the secure grip which you are able to obtain by such a method. The circular fulcrum shown at the centre of the jaws holds them in position while the work is being clamped, and at the same time allows for adjustment to the angle of the work. A set of these jaws in use is shown at Fig. 10.

It will be noted that in this case the work being gripped is a taper shank, an object difficult to grip by any other method, but by means of an ordinary miller vise and a pair of these jaws the trouble is solved at once.

Parallel Blocks

The uses of parallel blocks are many. They are used on almost every machine tool for blocking up purposes, for set-up work, and so on. The ordinary solid type are used extensively on planer work, for raising the work on the bed, while the box type as illustrated at Fig. 11 are used more for gauge and inspection work. Of course some concerns adopt this type for blocking up purposes also, but for our purpose we will illustrate only their use for inspection purposes.

At Fig. 12 we illustrate by two separate views how the box parallel can be used to advantage. As these blocks are finished accurately all over they can be turned to any desired position, giving quite a large range to work on. The only reason they are cored is to facilitate clamping, at the same time reducing their weight.

Angle Irons

As in the case of the parallel blocks there are innumerable styles and sizes of angle irons, but we will confine ourselves to one style only, that being the universal right angle iron. This type of iron is shown at Fig. 13, while a combination of three production tools is illustrated at Fig. 14.

In this case we see a parallel block, an adjustable knee, and a right angle iron, all combined. This is one example which brings forcibly home the fact that accurate measurements can only be obtained with accurate tools.

Universal Squares

An inspection tool, not used as often as it might be, is illustrated at Fig. 15. This tool, known as a universal square, is accurately made so that it will test squares, even when held at an angle to the surface being inspected for squareness. The knife edge and straight sides are finished to a high degree of accuracy. Every square is tested on both sides as shown at Fig. 15, and as can be noted, the centre of the square is of web construction covered with a hard rubber insulation, which provides an excellent grip. These squares are especially useful in setting dimensions which must be extremely accurate.

Take for example Fig. 16. Again we have an illustration of a combination of inspection tools, for here we see the universal square being used to set the sine bar fixture to a special measurement.

Fig. 17 depicts what is known as a measuring iron. This tool is so designed that it may be clamped to the table of a machine or surface plate, and to provide a fixed surface from which measurements can be conveniently taken. It is particularly adapted for use in connec-

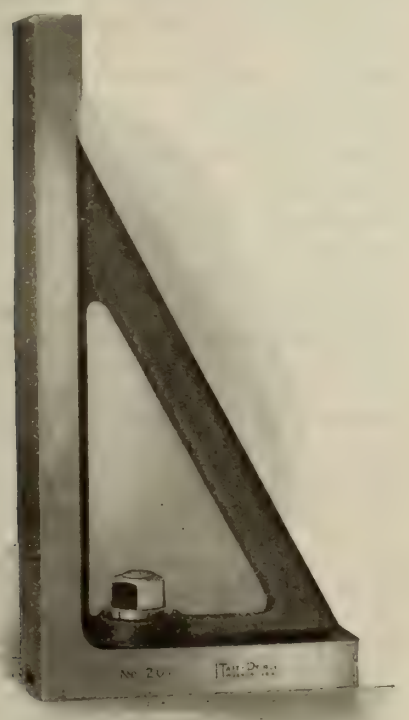

FIG. 17—A DETAIL VIEW OF ONE STYLE OF MEASURING IRON.

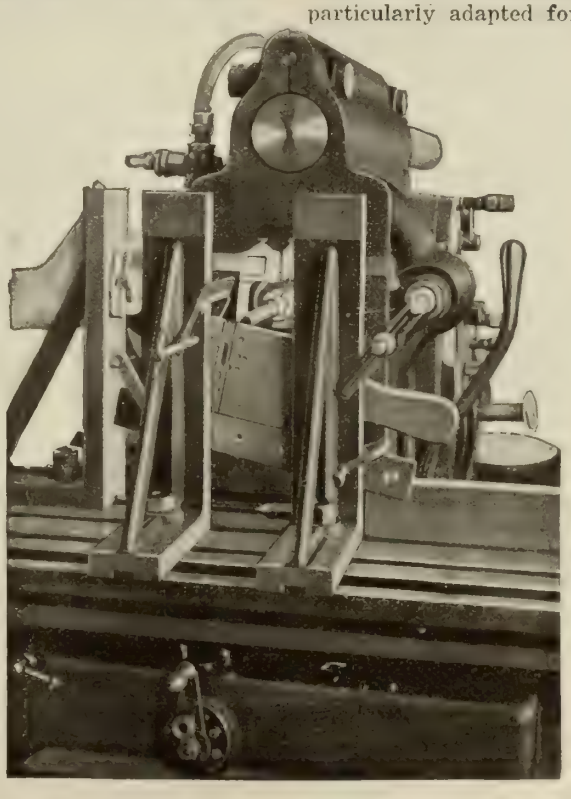

FIG. 18—A SET OF MEASURING IRONS USED FOR A BORING SET UP ON A MILLING MACHINE.

tion with accurate boring operations. As they are narrow, and occupy a small amount of table room, they provide a convenient means of clamping work while it is being machined.

At Fig. 18 we illustrate three of these measuring irons used in a boring set-up on a milling machine. Although shown on a milling machine these irons can be used equally as well on many other types of machine tools. Wherever a fixed surface is required, from which to take dimensions, the use of these irons will be found of great advantage.

Of course there are numerous inspection and production tools which we have not illustrated or described, including bench plates, indicators of all kinds, work centres, test plugs, etc., etc., but we have, however, pointed out the use of some of the more important tools with their attendant advantages.

To turn out accurate work, you must have accurate tools, handled by men who realize the necessity of care and accuracy. This condition makes for an ideal tool room, which in turn means accurate jigs and fixtures. Continuing the train of thought, we find that accurate fixtures mean an accurate product turned out at maximum speed, which, lastly, ensures an interchangeable product. From this we can safely conclude that all the aforementioned conditions are necessary in these modern days of keen competition and speed.

We would like to acknowledge our appreciation to the Taft, Pierce Co., of Woonsocket, R.I., who allowed us the use of the various illustrations throughout this article.

Two Interesting Styles of Boring Heads

By ROBERT MAWSON

A problem recently came up in our Mechanical Engineering Department to machine a large hole of 9 inches diameter.

This hole had to be concentric with a smaller one, accurate as regards size, and also parallel. The tool we designed for boring the large hole is shown in Fig. 1, and is known in the machine shop as a "Cat Head."

There are some features about the tool that are worth noting, especially regarding its construction. Most boring heads of this type are made too light and not sufficiently rugged. This is particularly the case with the boring or cutting tool proper.

Referring to the illustration: The body or holder "A" is made of a machine steel forging, accurately bored to suit the boring bar (which it might be added was supported on both ends in the head and tail members of a horizontal boring machine).

A flat was filed on the bar, and by screwing down a 7/16 inch set-screw in the tapped hole shown the boring head was held rigidly in position. The cutter "B" is made from a stock bar of high speed steel, suitably hardened.

To adjust the cutter for the correct diameter the screw "C" is first slackened and the square-head set-screw "D" tightened, which action forces out the cutter. After the correct size has been obtained the screw "C" is tightened and the cutter held rigidly in position for the machining operation. A pin was also driven through, and extended on each side of the boring bar. This pin fitted into the slot "E" and thus acted as a positive driving medium.

The boring head was a success as far as it went, but it can readily be seen that it has its limitations. For example, it is impossible to machine a hole to a square shoulder, in other words, it can only be used to machine a hole which goes entirely through the piece.

To meet these conditions (especially as one of the holes called for had a sharp corner as illustrated by the section, Fig. 2), the improved design of tool was made as shown at Fig. 3.

The head was made of a similar machine steel forging, the only difference being that the cutter was placed with the angle away from the vertical centre line instead of towards it as shown at Fig. 1. With this latter construction the cutting edge projects beyond the body of the tool and a sharp corner may thus be obtained.

A further advantage of the improved design is that by placing a bar or plug gauge in the 1.500 hole and using a pair of micrometers the actual size which the boring head will machine can be readily determined, namely, 4.500 + .750 = 5.250 inches will be the reading on the micrometer.

Both boring heads have given the best of satisfaction, producing holes mechanically correct in every detail.

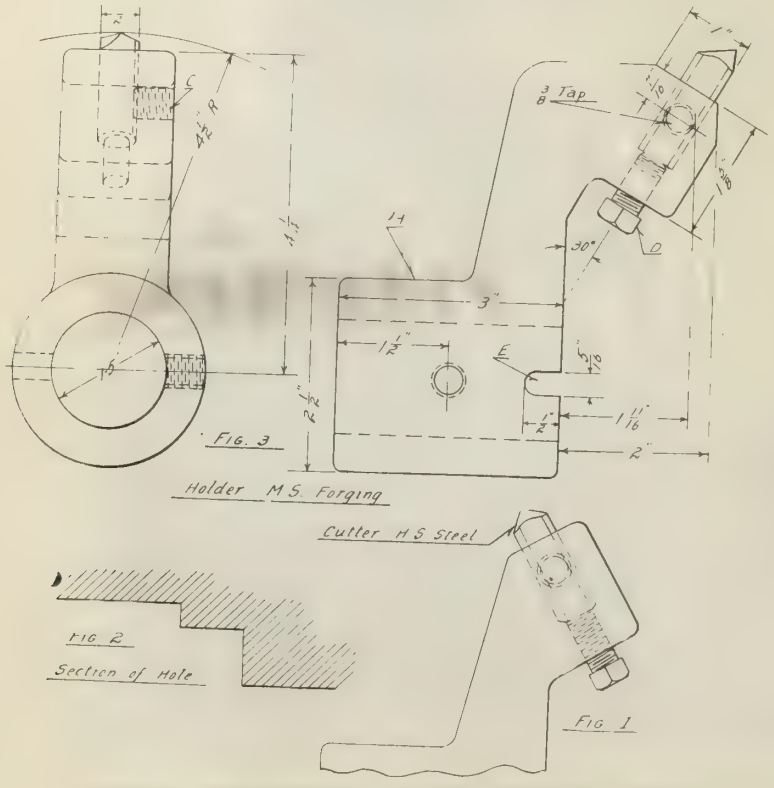

FIG. 3 FIG. 2 FIG. 1

GENERAL VIEW SHOWING THE TWO STYLES OF HEADS.

Copper pipe coils that require tinning may be coated with pure block tin without dipping into a tin bath. The coil should be suspended between two supports on an iron bar or pipe so that it can be freely turned around as the tinning proceeds. The copper coil is heated, section by section, with a preheating blowtorch, and the surface is fluxed with chloride of zinc. The tin is applied from time to time from the end of the bar, and is wiped with a swab made of white cotton waste soaked in the chloride of zinc solution. A clean wooden tray should be placed beneath the coil to catch the tin that runs off. With a little practice a welder can tin copper pipe coils and similar parts smoothly and quickly.

Spare no pains to make a good job when fitting up welding and cutting hose. Spread shellac on the nipples before forcing them into the hose. The shellac quickly hardens and makes not only a tight joint but a cemented joint uniting rubber to the metal.

Various Causes of Grinding Wheel Breakage

There Are Nine Important Reasons Why Grinding Wheels Break, According to the Author of This Article, Which Appeared in "Machine Tool Review." A Perusual Will Prove Worth While

By HAROLD E. JENKS

THE subject of grinding wheel breakage is one which directly concerns every wheel consumer as well as the manufacturer of the product.

Breakage of the wheel affects the consumer as well as the manufacturer of the product.

Breakage of the wheel affects the consumer, since it means danger to the operator and possibly to others in the shop. It also involves considerable expense due to the loss of the wheel itself and loss of time in procuring and mounting another one.

It affects the wheel manufacturer, since it is obviously for his interest to have as few breakages as possible charged up against his wheels, and since, if the cause of breakage is clearly due to manufacturing defects, he will be expected to replace the broken wheel at his own expense.

It is important, then, that wheel breakages should be reduced to a minimum. To do this, its underlying causes should be clearly understood, and it is with the purpose of making these causes clear that this article has been written.

Breakage of a grinding wheel while in operation may be due to any one of the following causes, or to a combination of two or more of them:

1. Centrifugal force due to rotation of the wheel.
2. Direct pressure exerted by the work on the wheel.
3. Heating of the wheel or spindle.
4. Grinding on the side of the wheel (side pressure).
5. Improper mounting.
6. Impact on the side of face of the wheel.
7. Cracks or flaws in the wheel structure.
8. Lack of balance.
9. Initial stresses.

It is unavoidable that these causes should overlap to some extent; for instance, heating of the wheel is a result of direct pressure by the work. It is thought, however, that the list has been condensed as much as possible to still retain the desirable property of clearness.

By "stress," as used here, is meant force acting betwen the particles of wheel material per unit of area let us say in pounds per square inch. Wheel material is much weaker under tensile stress than under compressive stress—that is, a much smaller force will break it if tending to pull its particles apart than if tending to push them together. For this reason, stresses are herein specified as tensile or compressive, it being understood that compressive stresses are not important as sources of breakage. Mathematical proof of statements made regarding the amount and position of stresses in wheels is beyond the scope of this article, and is therefore omitted.

Much importance should be attached to the fact that although not one of the existing stresses in a wheel may be excessive, the combination or resultant of two or more of them may be sufficient to cause breakage.

Centrifugal Force Due to Rotation of the Wheel

In any body which rotates about an axis, stresses are induced at every point due to centrifugal force, which is the force tending to make the body fly apart. In a grinding wheel these stresses are of two kinds: a radial stress acting in the direction of the radius of the wheel; and a tangential stress acting in a direction perpendicular to the radius. Both these stresses are tensile. The tangential stress is much the larger of the two, and reaches its greatest value at the inside of the wheel—that is, around the circumference of the hole.

The radial stress has its maximum at a point from one-third to three-fourths the distance from the face of the wheel to the hole. The amounts of both stresses vary as the square of the wheel speed, which means that if the speed is doubled the stresses are quadrupled. For a given peripheral speed and diameter of wheel, the maximum tangential stress increases slightly as the diameter of the hole is made larger, and in cylinder wheels becomes about 20 per cwt. greater than in disc wheels with ordinary sized holes.

Since a grinding wheel in operation is always revolving, stresses due to centrifugal force always exist; and although it is probable that comparatively few wheels in operation break from these stresses alone, others may easily combine with them and produce breakage.

Reliable grinding wheel manufacturers test all wheels before they leave the factory by running them at such speeds that the minimum safety factor is 2½ and the maximum in some cases as high as 5. As a result of this precaution, practically all breakages that occur from centrifugal force alone can be traced to such causes as shifting thoughtlessly from large to small pulleys, placing large wheels on spindles running at speeds intended for small ones, or substituting for a wheel running at the correct speed one of different grain and grade and lower recommended wheel speed. In other words, these breakages are nearly all due to carelessnes or ignorance on the part of the operator.

Direct Pressure Exerted by the Work on the Wheel

By "direct pressure" is meant pressure on the face of a wheel directed toward its centre. Stresses produced by this pressure are of two kinds—radial and tangential, or frictional.

The radial stress is the same as would be produced by direct pressure, if the wheel were not revolving, and is compressive. It is usually small in amount and is unimportant as a cause of breakage.

Contact between the particles of the revolving wheel and the work produces a frictional force whose amount is proportional to the direct pressure and which is in the direction of a tangent to the wheel face. This force causes bending stresses along a diametral section of the wheel which are tensile on one side of the centre and compressive on the other. These stresses reach their largest value at the face of the wheel, and are usually small and unimportant.

Heating of the Wheel or Spindle

Considerable heat is developed at the point of contact of wheel and work, and in cases where grinding is done dry the wheel may become very hot. The stresses produced by unequal expansion of different parts of the wheel may in this case reach a large value, and many breakages are probably due to this cause. These stresses are similar to those resulting from centrifugal force, and are (as in that case) of two kinds—radial and tangential. THEY MAY VARY GREATLY IN AMOUNT ACCORDING TO VARIATIONS IN TEMPERATURE OF THE WHEEL, AND AN EXACT DETERMINATION OF THEIR AMOUNT IS DIFFICULT, IF NOT IMPOSSIBLE. The greatest tensile stress occurs around the circumference of the hole and hence combines with the greatest stress due to centrifugal force.

Heating of the spindle may be produced by tight bearings on the machine; and if the wheel bushing fits the spindle tightly, expansion of the latter will cause tensile stresses of considerable magnitude in the wheel, which, adding to the maximum stress due to centrifugal force, may cause breakage.

Grinding on the Side of the Wheel (Side Pressure)

Many breakages are directly caused by side pressure, which occurs to a limited extent when work is being traversed across the face of the wheel, but principally when grinding is done on its

side. Also, particularly in snagging operations, large side pressure may be produced by grinding on or "working" the corners of the wheel face. The effect of side pressure is to produce a bending stress whose maximum reaches all points of the wheel as it revolves, and which is tensile on the side of the wheel which sustains the pressure and compressive on the other.

Properly designed flanges used on wheels of sufficient thickness are the best protection against breakage due to side pressure. They not only greatly reduce the maximum stress due to this pressure, but prevent its attaining its maximum at the circumference of the hole, where it would otherwise combine with the maximum due to centrifugal force.

Improper Mounting

This subject is of such importance to all grinding wheel users that it is thought advisable to first give the following brief statement of the essentials of correct mounting:

Care should be taken that the sides of the wheel and the sides of the flanges in contact with the wheel are plane surfaces, in order that an even bearing may be secured.

The hole should be of a diameter approximately .005 in. larger than the spindle or arbor on which the wheel is to be mounted, and must be at right angles to the sides of the wheel, concentric with the circumference. No portion of the bushing should project beyond the sides of the wheel.

The spindle should be perfectly straight and threaded in a direction such that any tendency for the wheel and nut to turn will tighten the nut.

Flanges are used primarily to transmit power from the shaft to the wheel, and for this reason the inside flange must be keyed to the shaft. Both flanges must have plane faces at right angles to the shaft, and should be properly relieved —that is, they should be countersunk so as to bear on the wheel only on the part of the side of the flange nearest the rim.

Blotters or some other form of compressible washers should be used between flange and wheel to insure an even bearing. Their diameter should be at least as large as that of the flanges.

The nut should be tightened only enough to properly hold the wheel. Further tightening is unnecessary and undesirable.

Stresses in the wheel due to improper mounting are particularly important because they all combine directly with the maximum due to centrifugal force.

Forcing a wheel on a spindle for which its hole is too small is extremely likely to result in breakage, as large tensile stresses are induced around the circumference of the hole. If the hole is too small, it should be carefully enlarged by scraping until a perfect fit is obtained.

Side pressure producing large tensile stresses may result from any defect in mounting which tends to produce uneven bearing between flanges and wheel, such as bent or broken flanges; projecting bushings; high spots on bearing surfaces of flanges or wheel; flanges not properly relieved; failure to use proper compressible washers; flanges of different diameters, or excessive tightening of the spindle nut.

Impact on the Side or Face of the Wheel

Probably most breakages due to impact are the result of carelessness or ignorance on the part of the operator. It should be borne in mind that stresses in a wheel produced by a suddenly applied force are very much larger than those produced by the same force if applied gradually.

The impact of the particles of the wheel on the work in any form of grinding produces certain stresses in the wheel, but these are carried more by the particles in direct contact with the work than by the wheel as a whole, and are not important as a cause of breakage. Cases have been known, however, where ignorant operators, in order to increase the speed of cutting, have hacked the face of the wheel in such manner as to cause breakage due to this form of impact.

Breakages are sometimes caused by bringing heavy pieces of work into too sudden contact with either the face or side of the wheel. Carelessness in snagging castings suspended from chain hoists, for example, might easily produce breakage of this kind.

In work requiring a table traverse, the headstock of footstock may be run into the wheel, which will cause wheel breakages unless something else gives way first. This is not true impact, but approaches it on account of the suddenness of application of the force, and results in larger stresses due to side pressure.

Catching of the work between the wheel and the rest in free hand operations is very likely to cause wheel breakage. Such an accident may be due to improper adjustment of the rest or to lack of attention or ignorance on the part of the operator, and may have very serious consequences. This is a case of true impact, the speed of application of the force being practically the speed of the periphery of the wheel.

Cracks or Flaws in the Wheel Structure

Wheel breakage sometimes occurs because of cracks or flaws which are in the wheel before it is put in operation. Such defects may be entirely under the surface of the wheel and therefore not visible. Flaws are manufacturing defects, while cracks may be due to faulty manufacture or to various other causes, such as carelessness in transportation, handling, unpacking, or storage.

Due to the fact that the Norton Company uses such extreme care in testing wheels for flaws and cracks, it is practically impossible for a wheel with such defects to pass inspection and be shipped outside the factory.

The "ring" of a wheel, or sound produced by its vibration when tapped lightly with some solid object, is used as one indication of interior cracks or flaws. A wheel with a clear "ring" is fairly certain to be free from such defects, although it has been shown that a poor "ring" does not necessarily mean a defective wheel. Norton Company, however, in order to be on the safe side, rejects all wheels which do not ring clear.

After the test by "ringing" the wheel, all wheels of over 5-in. in diameter are given a speed test at about double the recommended operating speed, as stated previously. This is a very severe test and is practically certain to eliminate defective wheels.

Rigid inspection follows this speed test and the wheels are very carefully packed for shipping in strong boxes made especially for the purpose.

Breakages due to cracks are therefore beyond the control of the Norton Company, since these cracks must occur subsequent to the time the wheels are shipped.

Lack of Balance

A wheel that is out of balance has developed in it stresses of rather complex character. In cases where the lack of balance is very great, breakage may result, either from these stresses or from impact, as will appear below. Lack of balance may be due to several causes, the description of which follows:

Variations in density in a wheel may cause imperfect balance. However, this can hardly prove serious in the case of wheels furnished by any reliable grinding wheel manufacturer, as the homogeneity of structure of such wheels precludes the possibility of a dangerous amount of lack of balance.

If a wheel goes out of true for any reason, it will also go out of balance, since its centre of rotation will no longer be at its centre of gravity. Wheels may go out of true from such causes as a bent spindle, loose bearings, loose frame, improper use, or from the hacking of the wheel face previously mentioned. If a wheel is seriously out of true, it will deliver a series of blows to work thrust against it, thus producing large impact stresses. The stresses due to the centrifugal force of the out of balance portions of the wheel may also become large in this case, and will combine with the maximum due to centrifugal force.

A wheel should not be allowed to stand partially submerged in water or other liquid, for when it is started in motion the wet portion is much heavier than any other and hence the wheel is greatly out of balance. Several cases of breakage from this cause are known.

During the process of manufacture of any solid body, initial stresses are sometimes set up in the material of which the body is composed. Unless great care is used in its manufacture, a grinding wheel may have such stresses existing in it. These may be regarded as incipient flaws or cracks, and may combine with other stresses to increase the maximum stress in the wheel. No method has yet been devised for determining the existence of initial stresses in wheels.

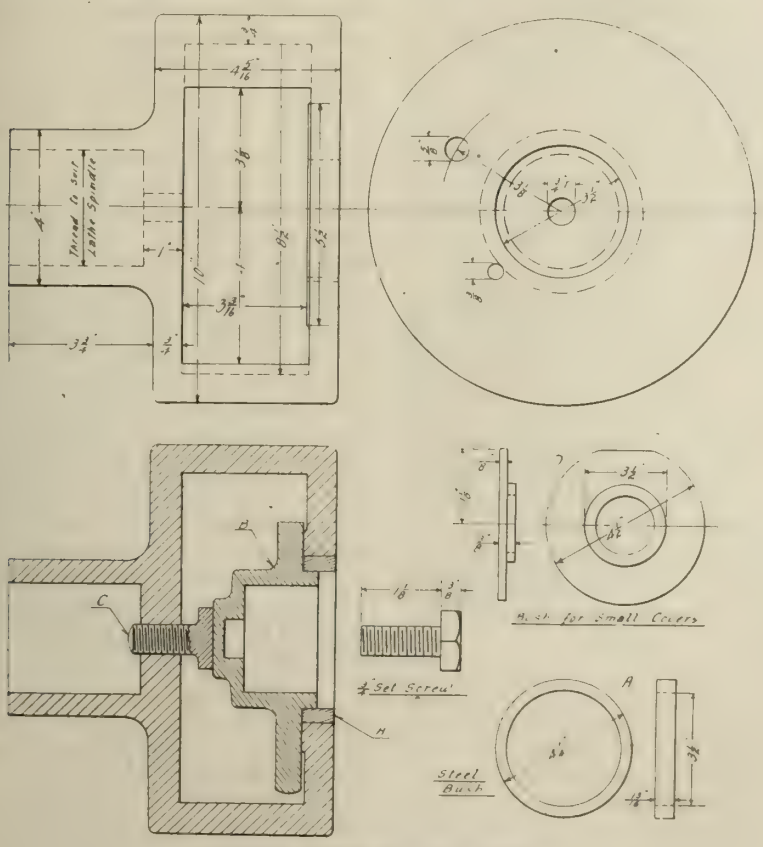
However, Norton Company by the speed test mentioned above eliminates from its finished product all wheels with large initial stresses. By running all wheels at double the recommended operating speed and thus quadrupling the stress due to centrifugal force, any wheels having extraordinary initial stresses are broken.

On account of the number and variety of the possible causes of wheel breakage given above, it is easily seen that the actual determination of the real cause of breakage of a single wheel may be difficult or impossible. In cases, however, where breakages occur consistently with a certain operator or on a certain machine or operation, it may be reasonably assumed that there are one or two principal causes involved which can by a study of the situation be detected and removed.

A conservative statement, based on experiments, investigation, and long experience with wheel breakages, is that practically all breakages are due to causes beyond the control of the grinding wheel manufacturer and may in no way be attributed to weakness in wheel structure.

Boring Jig for Valve Covers on Air Pump

By ANGUS McALPINE



THE accompanying sketch shows a jig for boring the main valve covers of Westinghouse air pump. After being on the road a while, these covers show wear, and have either to be trued up or bushed. The ordinary method is to put the cover in an ordinary dog chuck, catching them by the outside edge of flange.

This is a very important operation, and the work has to be accurately performed, consequently a great deal of time has to be spent setting up. The time spent setting up has become a bugbear, and when the covers come singly they are generally scrapped and a new one applied.

Of course, when twenty or thirty come in from the line, they have to be repaired, and it was to meet such requirements that this jig was designed. The jig itself is just a circular box chuck which is applied to the lathe spindle.

The front is bored out 4¼ inches and hardened mild steel, bush A pressed in. A machining strip is left on the back of the front face for flange of bush to be applied to. Cover is slipped into chuck and the lip on same fits into the mild steel bush. Set-screw C is then brought to bear on cover, forcing flange against the inside face of chuck, automatically trueing the job.

If the set-screw pressure is not sufficient, a driving bolt can be applied through hole in chuck and bolt hole in flange of cover. The sketch is for 11 in. pump, but when the 9½ in. size is to be machined, the bush D is applied.

VARIOUS VIEWS OF THE FIXTURE.

LETTERING ON METAL SURFACES

By Donald A. Hampson

Once in a while there comes up a job of lettering out in the shop to which a draftsman falls heir because of his experience on similar (?) work on the drawing board. Two instances of this kind will be related, for they may help someone else who suddenly finds that lettering on metal is quite different from paper.

It was desired to bring the cast letters of the maker's name into greater prominence by gilding them. The 35 cent packages of gilt put up for household use are all that is needed for the work, but the brush supplied with them is too large and a striping brush must be selected; this will make a line from one-sixteenth to an eighth of an inch in width. The gilt must be mixed quite thin, and only enough carried on the brush for a single line. The flexibility of a brush is in marked contrast to the firmness of a pencil, and some practice will be necessary to get used to making a line by drawing the brush along on its side instead of using the point. Too much gilt will cause horizontal lines to break and run; it will cause vertical ones to bulge at the bottom. Where there is no good support for the hand, a light stick, held in the left hand and resting upon another part of the face, bridges the gap and steadies the marking hand.

Another instance was that of a metal cabinet having about three hundred sizes stamped on the front with ¼-inch figures. Against the green background these did not stand out as they should, and it was decided to make the sizes white. White enamel was used for this, and as it was an impossibility to trace the shape of the figures with a brush, an eighth-inch brush was used to fill the depressions in rough approximation of the stamped shape. The worst of the excess was wiped off with a linen cloth wrapped around the finger. Then a piece of soft rubber, trimmed square and straight, was drawn over the surface, removing effectually any blur remaining from the previous operation and leaving the letters standing out sharp and white.

An alloy of zinc and copper, the composition of which, it is stated, metallurgists have made every effort to determine without success, has made its appearance in Italy, where it has quickly demonstrated its usefulness. It is called Biakametal and United States Trade Commissioner H. C. MacLean, at Rome, has sent a report on it to the Department of Commerce at Washington. A new company having a capital of $2,316,000 has been formed to carry on its manufacture. It is said to have a high limit of elasticity and high resistance to thermic and to chemical action. It can be cast, turned, drawn, forged, rolled and stamped and has proved useful in aeronautic and marine construction on account of its relatively light weight and unusual strength and anti-corrosive qualities.

WELDING AND CUTTING

Fusion Welding Applied to Drop Forgings*

By S. W. MILLER

IT has been found that in such steels, particularly where the piece welded is of considerable size, the quenching effect of the cold metal produces a zone of sorbitic character next the weld, which may start a detail fracture under alternating stress. The work referred to is of the nature of adding material to worn shafts in order to turn them up again to the proper size. While the welding is successful, the alteration of the structure is dangerous. This difficulty can be readily overcome by preheating the shafts to a high enough temperature to prevent the formation of the brittle zone. This temperature would depend on the size of the shaft, being less for a large shaft than for a small one. The slow cooling, due to the preheating, prevents the formation of sorbite and no trouble is experienced.

With oxy-acetylene welding, this defect does not exist, as the piece being welded must be brought to a high temperature before any welding is done, and this is sufficient to anneal the material near the weld.

Breaking Welded Pieces by Test

In making tests of welded pieces, it is essential to know the qualities of the material being welded if fair comparisons are to be made; for instance, in very soft material, having a tensile strength of about 50,000 lb. per sq. in., where the weld is of the same section as the rest of the piece, the chances are that a sound weld made by either process will be strong enough to break the original material, so that the figures obtained are those of the original material and not those of the weld. On the other hand, if the original material is of 60,000 lb. tensile strength the chances are that even with the weld somewhat reinforced the break will take place in the weld. The writer feels it necessary, therefore, to measure the elongation, not only in the total gauge length, but in each inch between the gauge marks in order to be sure of what the figures do represent. In the net results given above for oxy-acetylene welds, the yield points are those of the welds, while in the tests given below for electric welds the yield points are those of the original material.

	T.S.	Y.P.	Elongation in centre 2 in.	Broke
Electric ..	51,200	.....	...	Outside Weld
	51,600	31,300	...	Outside Weld
Welds ...	51,300	33,300	7.5%	Inside Weld
	50,500	32,200	7.0%	Inside Weld

As stated before, the elongation of electric weld material itself is very low, and the yield point, therefore, is very close to the ultimate strength. It will be noticed that the elongation is very small and an examination of the test pieces will show that most of it is in the original material.

While it is not always of great importance in the repair of drop forgings to consider the character of welds with regard to their soundness, because usually welds are not made in parts which require great care in order to get the best results. It may be of interest to know that in the writer's experience the quickest and easiest way of determining a welder's ability is to have him weld together two pieces of ½ x 2 in. ordinary bar steel in the case of gas welding, or two pieces of ½ x 3 in. bar steel in the case of electric welding. The reason for using the wider piece in electric welding is that both the beginning and end of an electric weld are liable to be bad for ½ in. from the edge. The beginning is bad because the temperature has not been raised to the proper point and the end is bad because the temperature was too high. With oxy-acetylene welding the temperature at the beginning and end can be regulated by the operator. The electric weld should be machined off for ½ in. on each side, leaving the piece about 2 in. wide. If such pieces are then clamped on an anvil or heavy block, so that the bottom of the V is on a line with the face of the anvil, and the projecting part of the piece is struck with a sledge, a very good and rapid test can be made of its quality.

It will be found that electric welds are very brittle and will not give much bending, while gas welds will bend down flat and will even stand further bending before cracking on the outside of the weld if they are properly made. An examination of the fracture will indicate the mechanical soundness of the weld. Beyond this the welder cannot go, as he has but little to do with the metallurgical character of the weld.

Welding Heat Changes Structure

The physical structures of welds are of great interest and importance. In most cases they are what would naturally be expected from the high temperatures involved in the welding operation, but in the oxy-acetylene welds made with ordinary material, the weld is coarse-grained, and, on account of the distribution of heat, the grains are approximately equi-axed. Most of the carbon has been burned out by the heat so that what is left exists as isolated particles of cementite at the grain boundaries, as in very low carbon steel. There is always present more or less oxide, which is readily seen in an unetched section as small, round, dark dots. There are frequently minute holes, probably caused by the escape of occluded gases during cooling. Especially in the tops of welds made with a heavier tip than necessary, there are plates and needles of what is probably nitride of iron, due to the combining of the nitrogen of the air with some of the iron. The material next the weld is coarsened by the heat and somewhat decarbonized for some distance below the original surface. Between the body of the weld and the original material there is a zone of gradually changing carbon content as would be naturally expected. In this zone, unless proper fusion has occurred, there are liable to be films of oxide of great thinness, which are not visible in the polished section but which etching shows up distinctly. These films are of the order of a 1/50,000 in. thick, and have the effect of causing the weld to break along the line of the V; greatly decreasing its tensile strength and elongation; they are also fatal under alternating stress. Similar defects are liable also to be in the body of the weld where it has been poorly made; but they do not exist in any place in a properly made weld. The burning out of carbon and the presence of oxide dots cannot be avoided, and they are the only defects which should exist in a good oxy-acetylene weld. The nitride of iron is probably of little importance as far as ultimate strength is concerned, although it may have some effect on the elongation, and, as it should not exist in a good weld, its effect can usually be neglected.

Electric welds have the same general characteristics as oxy-acetylene welds, the difference being in degree only. The grains are frequently columnar, their log

*Continuation of a paper presented before the Sixth Annual Convention of the American Forge Association, Pittsburgh, June 14th. The author is proprietor of the Rochester Welding Works, Rochester, N.Y.

axes being perpendicular to the surfaces of the Vs in the original material. The layers of metal applied later refine the grain of the first layer, changing the columnar structure to an equi-axed one, so that some discretion must be used in interpreting this and other features of such welds. The reason for the columnar structure is the very rapid cooling due to the great localness of the heat. The same result is produced in ordinary steel ingots by the old walls of the moulds. The coarsening of the grain in the original material occurs in electric welds as well as in oxy-acetylene ones, but to a less extent because of shorter time of application of the heat. In all fusion welds there is a zone at some distance from the weld line in which the grain is much finer than in the original material. This zone is further away from the weld with the oxy-acetylene than with the electric process. Its distance varies with the thickness of the piece, being greater with thicker pieces, and is about 1½ in. in the case of a gas weld made in ¾ in. steel plate. Electric welds contain larger amounts of oxide than do oxy-acetylene welds, and they are also much more subject to defects in the form of oxide films and slag pockets for reasons already explained.

Nitride of Iron in Arc Welds

The special difference between electric and oxy-acetylene welds, however, is in the presence of large amounts of nitride or iron, which, as explained before, is caused by the nitrogen of the air combining with the iron at the very high temperature of the arc. Although this material has not been isolated as yet, a comparison with material that is known to be nitride of iron leaves little doubt of its identity. Nitride of iron resembles cementite very strongly with ordinary etching, although it does not blacken with sodium picrate etching, as does cementite. Nitride of iron, when present in sufficient quantities, apparently forms a eutecoid with iron which very much resembles pearlite. All steels contain some nitrogen, but because there are many difficulties in the way of making analyses, not only for nitrogen, but for other gases or their compounds, and in view of the newness of the subject it is not to be wondered at that there are no accurate data as to the amounts of nitrogen in welds. Reasoning from analogy, however, it is probable that the average electric weld contains something in the neighbourhood of 0.2 per cent. nitrogen, which, if the formula of iron nitride be Fe N, would give 1.8 per cent. iron nitride. The appearance of an electric weld would lead one to believe that there is at least this amount of iron nitride present. The appearance of iron nitride varies from that of exceedingly thin plates of brilliant white material to masses of some size, and still further to the eutecoid referred to above. The plates are exceedingly thin, being probably at times of the order of 1/10,000 in. thick, and in many cases they appear in an etched section as dark lines of some thickness, but this is doubtless due to the acid eating off the corners of the metal next to the plates and making a groove which of course shows dark in the microscope. These plates lie along the same planes in the grains as do Neumann lines and do not lie along the slip planes. It is doubtless for this reason that they have but little effect on the strength or distortion of an electric weld. As the amount of nitride increases it collects in large masses, which finally appear as eutecoid. In the writer's opinion these masses of iron nitride contain some iron carbide, because parts of the spots darken with sodium picrate etching or with heat tinting, while in pure iron nitride there appears to be no such effect.

Reference has been made to the path of rupture in welds. As a comparison it may be stated that in sound iron or steel this path is always through the grains along the slip planes. In sound oxy-acetylene welds made with usual welding materials, the same path is followed, while in electric welds the path is, within the writer's experience, always along the grain boundaries.

PROCESS FOR REMOVING RIVETS AND CUTTING METALS

A recent invention by the Societe Anonyme d'Acetylene Dissous relates to a process for removing rivets and cutting metals by means of the electric arc.

Certain work in boiler construction and particularly in the repairing of ships in consequence of stranding, collision and the like, necessitates the removal of a large number of rivets. Formerly this removal was effected by cutting off one head of the rivet with a hand or machine tool and then punching the rivet out, but of late, use has been made of the oxygen process of metal cutting. The head of the rivet is first heated by the flame of the blowpipe cutter, and on reaching a suitable temperature is burnt off by a supplementary oxygen jet.

Also electricity has been used for separating or fusing the members of metallic structures by bringing a carbon electrode connected to one pole of any source of electricity into contact with the metalic material which is to be separated, the latter being connected with the other pole of the source of electricity. As is well known in all fusing operations in which an electric arc is used, the metal, as soon as it melts, is liable to oxidize and the oxide formed interferes with the heat transmitted by the electric arc and considerable time is lots in the operation.

The object of the present invention is a process which effects the removal of rivets or cutting of metals by means of the electric arc without any loss of time.

The process consists essentially in fusing the head of the rivet by an electric arc of suitable intensity, and at the same time enabling the metal of the rivet head to combine with substanaces adapted to form therewith compounds which are sufficiently fusible and liquid at the working temperature to flow readily, or be blown away by the wind of the arc. To this end the metal piece of which the rivet forms part is connected to one pole of a source of electricity, whilst the second pole is connected to an electrode consisting of an iron or steel rod, the diameter of which may vary between 1-16 inch and ⅜ inch, and which is covered by a coating containing the substance which is to enter into combination with the metal of the rivet head. As soon as the electrode is placed in contact with the rivet head the arc develops and the metal and the rivet run away in the form of liquid slag, without loss of time. The most suitable substances for making the coating of the electrode are oxidising substances, fluxes such as borax, and silicates, and substances such as carbon, which form fusible alloys with iron. Particularly interesting result are obtained with a coating essentially composed of hydrated silicates to which a small amount of carbon in powder form may be advantageously added. With an electrode about 3-16 inch diameter coater with such a covering 1-16 inch thick, and with a continuous current of 250 to 300 amperes, the head of a counter-sunk rivet 1 inch diameter can be destroyed in about 20 seconds.

It should be understood that without departing from the scope or the invention other means than the above described may be used for the purpose of bringing into contact with the heated metal, substances adapted to enter into combination with same and form fusible products, for instance the fusible substances may be arranged in the form of a rod or the like along the electrode.

It should be remarked that the metal of the rivet head is not necessarily entirely converted into slag or fusible alloy. Part of this metal can be carried away, as is the case in the process with blowpipe cutters, in the slag or fusible alloy without having entered into combination.

The diameter of the electrode and the intensity of the current may vary within fairly wide limits. Nevertheless a current intensity of 250 to 300 amperes (continuous current) should not be exceeded when it is desired to remove rivets without deteriorating the plate in which they are fixed.

This process can be employed with alternating current and for piercing and cutting plates and beams, but it is of more particular interest for the removal of rivets.—"Acetylene & Welding Journal."

A new heat insulating material is being produced in Sweden which is stated to be very promising, says the "Electrician." The chief constituent in this new material is a kind of clay found on the island of Mors. This "molera," as it is termed, is very porous, and each grain appears to be hollow. This fact is no doubt largely responsible for the good heat insulating properties. After it has been burnt the molera becomes extremely light. Before it is burnt it is mixed with cork. The new insulator is said to be primarily suitable for the lagging of steam pipes and boilers, but may also have uses for the production of soundproof chambers, and as a medium to check the transmission of vibration.

DEVELOPMENTS IN SHOP EQUIPMENT

THE OLIVER NO. 1 UNIVERSAL PATTERNMAKER'S VISE

The Oliver Machinery Company, of Grand Rapids, Mich., have just placed on the market a new and improved patternmakers' and general woodworkers' vise, known as the Victor patent, which has many features worthy of notice. A few views of the vise and its capabilities are shown in the accompanying illustrations.

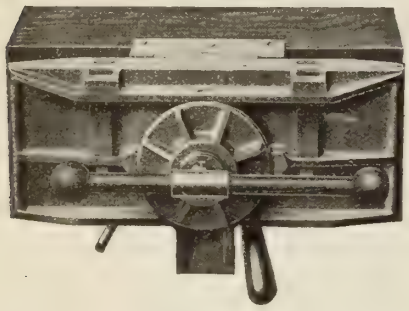


FIG. 1.

Fig. 1 illustrating the Oliver No. 1 universal vise in natural position, flush with the bench top. One is at once impressed by its sturdy and finished appearance—it is the last word in vise construction. Yet only fifteen parts are used and every part is interchangeable. Although the jaws appear lighter, yet, because of the deep web construction they are actually stronger, and under

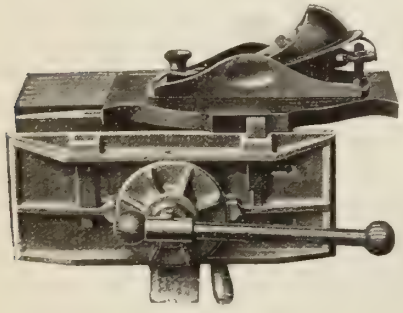

FIG. 2.

test have shown ability to withstand at least 300 pounds more pressure than jaws of other vises.

Fig. 2 shows that there is no limit to the work that can be done with this vise. It will securely hold all classes of work that any patternmaker or woodworker will need it for. This illustration shows the holding dogs for use in surface working on thin wood. Their use is also of great advantage in panel and framing work. Their utility can be further augmented by arranging additional dogs (hardwood) in the top of the work bench directly opposite those in the vise for holding forms or cases.

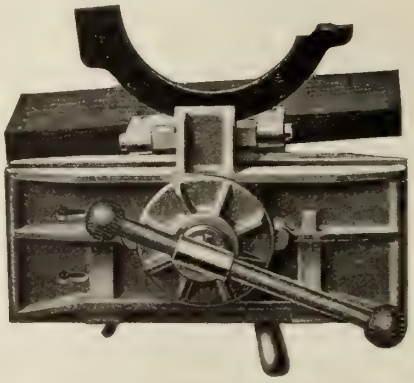

FIG. 3.

Fig. 3 shows the vise swung around and the pair of jaws provided for the holding of metal parts thrown into position to hold the metal parts to be worked upon. The sturdy construction of every part of the vise and its adaptability for every purpose is here plainly shown. The screws of the vise are double thread 4-pitch Acme, cold-rolled steel of ⅞-inch diameter. The weight of the vise is only 75 pounds.

Fig. 4 shows the vise in one of the many convenient positions in which it can be set, to easily handle irregular-shaped work. Because the jaws turn on the beam when set to revolve they may be located and clamped at any desired angle (not at particular set angles as on

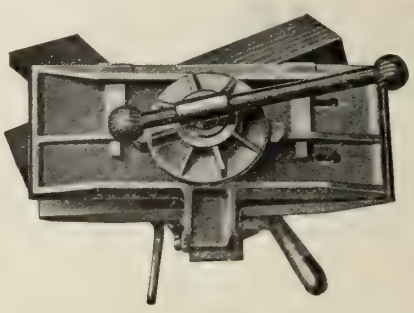

FIG. 4.

the obsolete types). The hand-operated, adjustable collar makes the adjustment for odd shapes and wedges a simple and speedy matter.

Fig. 5 shows the vise holding wedge-shaped work. The jaws are made to swing, being pivoted in the centre, so wedge-shaped work will fit either end of the jaws. The hand-operated adjustable collar makes the adjustment simple and easy. Note also the finished and substantial construction of the hub, which is part of the back jaw; the hand clamp lever used for revolving jaws and the beam, which in most every position

FIG. 5.

protects the screw from foreign matter, being closed side up.

Fig. 6 shows the vise in upright position with tilt or angle jaw in place. Note the rack bar which is used for clamping jaws in any angular position. This bar is flat and holds very rigidly, whereas

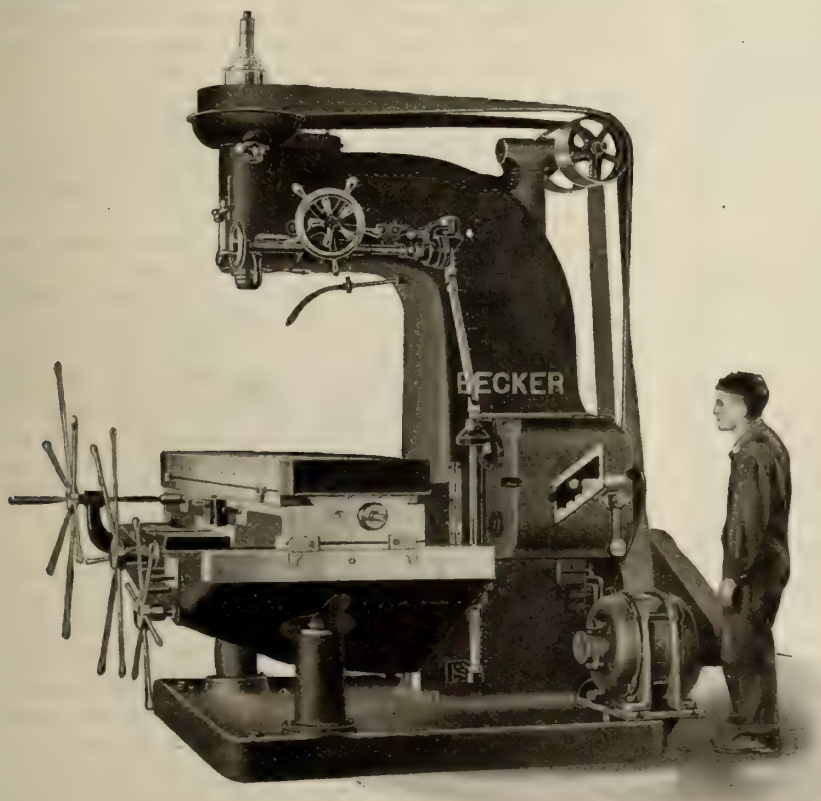
FIG. 6.

on other vises this is round and often allows the work to slip from its angular position. The jaws of the Oliver Universal No. 1 are smoothly finished; they are 7 inches by 18 inches in size, and have an opening of 15 inches. Its many special features make this an indispensable tool for the patternmaker's bench.

BECKER DIE-SINKING MACHINE

The Becker Milling Machine Co., Hyde Park, Boston, Mass., have recently added to their line of milling machines. This new addition is known as a Model D-1 die sinker, and is said to have an exceptionally wide range and capacity. The machine was designed primarily for die-sinking, where an ample range is required owing to the size of the largest dies which run up to 10 tons in weight, and at the same time is capable of performing accurate die-sinking operations. The light spindle allows great ease of manipulation, which is necessary to get the delicate adjustment required to "follow the line" with convenience to the operator. This machine incorporates most of the improved features of the later types of milling machines manufactured by this company, together with many new and valuable improvements. It is rigidly constructed, and the knee, saddle, and table have been made exceptionally rugged. The knee, which is of great width, is elevated and lowered through two telescopic screws that are connected by gearing to move simultaneously, and being perfectly co-ordinated they are controlled by a single lever. In order to correct the alignment of the table, due to wear of the mechanism, an adjustment is provided on each screw. These screws also provide a double support for the knee, each screw being well out from the centre of the machine to prevent undue deflection in the table caused by the numerous stresses incident to the large overhang when the table is moved to its extreme limit on either side. The knee is also supported by the frame or column of the machine by means of the Becker patented knee gibbing.

The knee is reinforced by heavy ribs running in both directions, which are cast on the inside, and the spaces between the ribs on the top surface are closed by hand hole covers which prevent the accumulation of dirt and chips. The saddle is the same length as the table, namely, 96 inches, and slides on a tapered gib at the centre of the knee, having in addition a wide flat way at each end, thus providing five generous bearing surfaces. The table is attached to the saddle by a straight gib and has a bearing the full length of the working surface, and it is provided with power rapid traverse in either direction, also a fine hand adjustment which is controlled from the front of the knee or at either end of the table. There are three ¾-inch T-slots in the table, oil-grooves on the side, and an oil-pan at each end for collecting the cutting lubricant, which is returned to a tank cast in the base of the column by means of a flexible metallic tube.



A particular feature of this machine is the centralized control, which allows the operator, standing in his position at the front of the machine, to operate all hand and power feeds conveniently. Adjustable stops are provided for all of the various movements. The spindle is back-geared and driven by a 5-inch double waterproof belt, which transmits power to the spindle quite uniformly and gives to the work the smooth finish so much desired in die-sinking and similar work. The spindle is of the "barrel type" of construction and is provided with an adjustable automatic stop, a micrometer stop gauge, fine hand adjustment, and a quick-return mechanism. The spindle is made of crucible steel and it is carried in a conical sleeve bushed with hard bronze bearings. Collars are provided for adjusting to compensate for wear in the bearings. The end thrust is carried upon ball thrust bearings supported on the end of the conical sleeve. This construction prevents the possible seizure of the spindle due to unequal expansion of the bronze and iron. The micrometer stop is located directly on the front of the spindle, this position having been found very convenient for setting operations. The stop and the slot in which it runs can be seen on the front of the spindle head. In working out the design of this machine the back gears are located on the upper part of the head directly under the spindle-driving pulley, and they are operated by a small lever projecting from the bottom of the bowl-shaped casting just beneath the spindle pulley. The feed-box is of the positive gear type. The feed is obtained from the lower drive shaft by a gear train to the feed-box. Eight feeds are obtained for each motor speed in geometrical progression, making it convenient to obtain any feed that may be most suitable for the particular job that is being done.

There are thirty-two feeds obtainable with a multi-speed motor and fifty-six feeds with the constant-speed motor, as follows: With an open belt, varying from 0.0024 to 0.0621 inch per spindle revolution, and with back-gears from 0.0126 to 0.3260 inch per spindle revolution.

There are fourteen spindle speeds obtainable when the power is supplied from lineshafting through the speed-box or from a constant-speed motor direct connected to the speed-box, varying from 73 to 438 revolutions per minute with open belt, and 14 to 83 revolutions per minute with back-gears. Eight spindle speeds are obtainable when the power is supplied by a multi-speed motor varying from 149 to 447 revolutions per minute with the open belt, and from 28 to 84 revolutions per minute with the back-gears.

The spindle is provided with a draw-bar and is stopped and started by a treadle at the left of the base, when constant speed is provided. The moving member of the clutches for engaging the power rapid traverse to the table is so made that it is impossible for both to be engaged at the same time. When motor drive is desired, the motor is placed on an extension of the base of the machine at the right side at the rear. A 7½-horsepower constant-speed motor running at 1,200 revolutions per minute, or a 7½-horsepower multi-speed motor with speeds of 600, 900, 1,200 and 1,800 revolutions per minute, or a 7½-horsepower variable-speed motor having a ratio of 3 to 1, is recommended. When either a multi-speed or a variable-speed motor is used, the speed-box is not necessary.

Extras, such as arbor supports, an oil-pump with connections, a rotary table with a circular top graduated to 360 degrees, having a working surface 30 inches in diameter and a draw-in chuck for holding cutters, can be furnished. Another important device is the cherrying attachment for die-sinking.

As We Were Saying

DURING the dying days of the year the daily newspapers devoted a large amount of space and a goodly number of scare heads to what they called a revolutionary discovery in the steel trade. This outbreak was based on cables received from correspondents in England, where the discovery was supposed to have been made, and nothing was left out that would tend to the embellishment of the reports. Briefly, they stated that Professor Arnold, of Sheffield, had discovered a new steel, called molybdenum, which would displace every other steel in the market. The British Government had placed an embargo on the patent, and were going to keep it for themselves alone, though according to the hopeful press writers, other nations were falling over themselves to get it.

In our issue of December 25th, under the heading "The Use of Molybdenum," we pointed out that molybdenum was not new, and its use in the manufacture of steel was not new. We gave a brief summary of the various alloys used in steel making, and their effects on the finished product, and pointed out that molybdenum possessed practically the same properties as tungsten, but less molybdenum was required for the same effect than would be necessary if tungsten were used. We suggested that Prof. Arnold's discovery lay in the direction of making molybdenum more amenable of application commercially than had been the case in the past. With the information we had at the time we could not say very much about the reliability of the claims set forth. Our experience is that the enthusiasm of the daily press on engineering matters is about equalled by their inaccuracy.

In the issue of "The Engineer" published on Jan. 2nd in London, we find confirmation of our views on the matter. Being on the spot, and in close touch with British steel activities, "The Engineer" is in a position to speak with authority on the subject. After remarking that if engineering were entrusted to the daily press it would increase in excitement if not in accuracy, they characterize the report as a wild story. The fact was that Prof. Arnold had during the war patented a tool steel that contained 6 per cent. molybdenum in place of the 15 to 18 per cent. tungsten generally used. Publication of the patent was suppressed precisely as all others were suppressed in war time, prevent the enemy obtaining particulars of it. When the news was released, the Sheffield steel trade didn't bat an eye. It is admitted that molybdenum has some slight advantages over tungsten, but as it costs three times as much as the latter, its superiority is not overwhelming. "The Engineer" thinks that in course of time molybdenum steel may win an important position in the market, but at present interest in it is chiefly from the scientific and not the practical point of view.

The steel trade seems to present many pitfalls for the unwary front page writer. It is not very long since that a Toronto daily published some wonderfully inaccurate descriptions of an electric furnace installation. We appreciate the fact that the front page has to be filled, but why not stick to the comparatively safe and indisputable stories of the sea serpent and dinosauria that were once so popular?

A Triumph in Projectiles

NEW developments have been made in bringing out a hard shell in Britain for the use of the navy. Sir Robert Hadfield makes the announcement: "The feat has been accomplished of getting the largest calibre of armor-piercing shell unbroken through the thickest of modern hard-faced armor plates."

Heretofore, the heaviest projectiles have been those used on the British monitors. The gun in which these were used probably weighs 150 tons, and when elevated to 45 degrees carries its projectiles 50,000 yards, or, say, thirty miles.

A writer in a British paper gives some idea of the penetrating power of these shells as follows:—

The shell, when capped and fired, and striking normally is capable of perforating armor of the following thicknesses, the shell itself emerging unbroken on the other side of the plate: (a) At point-blank range, no less than 41 in. of hard-faced armor. This is equivalent to a wall of unhardened steel of about 54 in.; (b) At 10 miles and 20 miles respectively, 22 in. and 12½ in. of hard-faced armor of the latest and best type. (c) Finally, at the extreme range of no less than 30 miles, armor of ordinary steel having a thickness of close upon 1 ft.

As a matter of fact, the shell in actual trials perforated a hard-faced plate of a thickness nearly equal to its calibre at a velocity equivalent to a range of about 14 miles. Thus the heaviest armor afloat, when attacked by it, would not be much better than a piece of cardboard.

The difficulty of hardening an armor-piercing shell of these dimensions will be readily understood, for suddenly "in the twinkling of an eye" a volume of something like 10,000 cubic inches of steel by quenching has to be converted from material of a Brinell ball hardness of only about 200 to one of between 600 and 700. To deal with the strains set up by the sudden change from what is almost material of plastic nature to one of extreme rigidity is indeed a difficult problem, as can be well imagined when it is stated that material of this high rigidity readily scratches glass. In addition, it must be borne in mind that the rupture strains which are set up by the sudden cooling mentioned may continue, not for hours, but for day, weeks or even months afterwards.

The following figures in regard to marine disasters are useful for reference:—The largest recorded loss of life in a marine disaster occurred when the Titanic was sunk, after colliding with an iceberg, south of Newfoundland on April 14, 1912, the list of deaths showing 1,503 names. The Lusitania, sunk by a German submarine, May 7, 1915, carried with her more than 1,200 of her passengers and crew. When the Empress of Ireland was sent to the bottom in the Gulf of St. Lawrence on May 30, 1914, the loss of life was 1,027. One thousand died when the Japanese steamer Kicker Maru sank in Australian waters on September 28, 1912.

Selling Steel Eight Months Ago and Now

By A. R. K.

SAY, it wasn't more than six or eight months ago that folks in the steel trade were coaxing their should-be customers to come into the ring and roll up a mill tonnage.

They had a good yarn to tell them, too, and they had it off word for word. The whole business of selling was being learned all over again. You know, during the war steel salesmen got soft. Their chests dropped down into their laps, and they got into the habit of wearing spats, morning coats and putting perfume on their handkerchiefs.

When it became known that a steel salesman was in town all he had to do was pick out the best invitation from the assortment of free dinners offered to him. He could have anything from "ham and—" to taking every known hurdle between soup and nuts.

But the end of the war knocked out his props and the steel salesman had to get out on the turf. There were double chins to be talked off—there were rotund figures to be machined, and there was, worst of all, a right-about from the days when the chief job was head liar and apologist for the firm.

Yes, Angus, these stall-fed, crate-stuffed tribe had to get out with a rail, a plate, a T-beam, a bundle of sheets, an assortment of bars, and sell the stuff. The open door policy was canned everywhere. They had to send in their little cardboard tickets once more and decorate the little bench where superintendents and purchasing agents make folks sit for awhile in order to justify their pay cheque. You know a superintendent or any other official who lets folks come right in and see him is going to fail. He ought to make 'em sit on that bench outside while he cleans his nails, reads the sporting page and does most everything except manicure his teeth and take a bath. Then the benchers are sure to murmur, "Busy guy," and sooner or later the office hears it—"Busy guy." Next thing you know that sup. has a raise in pay, a pretty stenographer with those grey suede hip boots, and he's sent off to souse in sulphur baths for an acute case of overwork.

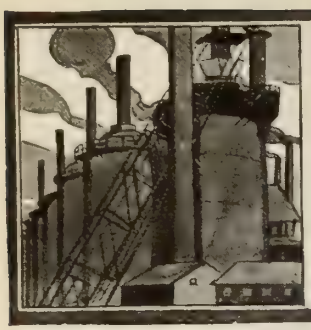
He Had To Get Out and Sell.

We enjoyed them days when steel salesmen were out again pawing the turf and spoiling the pasture. We got on speakin' terms with quite a heap of them. Not a bad sort, either, but they don't love each other, no more than a man loves to own up that he's wearin' a wig.

They used to be grateful for information then. To tell a man where to sell a ten-foot beam was regular Damon and Pythias stuff. Then it was that we was all smokin' the same good five-cent cigars together.

But things has changed again. Steel salesmen have simply to go to the front door of a place and holler, "I told you so." You can't talk back. If you take his "Told you so" chant in good part the chances are that he'll shove your order up toward the top of the heap and slip you a couple of sheets or fifty pounds of plate on toward the end of the year.

The way steel men's swaggerin' round now sniffs of boiled shirt fronts, clean socks and diamond studs.



"Gentlemen, it's like this . . ."

There's a nice fat job open in one office where they spend time now wondering when production is going to be tripping on the heels of orders. That job is for some good, fat, juicy person, who owns a claw-hammer coat, a corduroy vest and who don't object to wearin' a sweet-scented geranium leaf in his buttonhole in working hours. He's got to be head prevaricator for the office, smooth as oil and as convincing as Lydia Pinkham in her palmiest days. His chief job is to wave his hand and speak thusly: "Now, gentlemen, it's just like this. It's perfectly true that that we booked your business, but one of the ingots that was to be rolled into your order got misplaced before it reached the rolls. Investigation shows that the head office boy got out a tracer for that ingot. He located the man who was on the heat the day it left the open-hearth. That man's number is 1628 in the south building. Evidence as to who witnessed the ingot that 1628 saw leave the open-hearth being stripped and soaked is missing. Our last report, No. 678,356, from the cost department, says this ingot must be some place between the open-hearth and the soaking pit. As soon as we receive a further report on report No. 678,356 we shall be pleased to take the matter up further with you." Here the head explainer is supposed to have one hand on the shoulder of the customer and with the other is presenting a perfectly good 1920 six-cylinder smoke.

If the customer shows signs of restlessness, or looks as though he might cancel the order, Claw-hammer is supposed to recite a couple of verses of Browning, discuss the farmers in politics, the nebular hypothesis, the brotherhood of man, the setting of slide valves, what to do with the surplus of smallpox scabs. If all these things fail, Claw-hammer is likely to lose his job.

If you've got a friend in the steel business now, cultivate him, especially if he has any shipments pointed his way. Ask him out to your house and have your wife take a snap-shot of you and the steel man lookin' at each other with a sort of "You know me, Al" atmosphere on your face. It's a quicker way to get popular in the community than havin' a booze shipment from Montreal delivered at your house in broad daylight.

MARKET DEVELOPMENTS

Mills Refusing to Take Further Business

Offices Here Report That Business is Now Being Turned Back on Them—Big Order of Small Tools Went at a Price to Old Country Firm—Sheets Head the Shortage List

NO good purpose can possibly be served by minimizing the seriousness of the situation that has come to pass in the iron and steel markets in Canada. Some of the largest offices are having their business turned back on them now by their mills in the States. Their deliveries are already extended away to the end of the year, and they reckon that further bookings would simply complicate matters to no good purpose.

The situation in blue annealed sheets is particularly serious. One report has it that a large maker of automobiles three or four months ago sent his representatives all through the country, and cleaned up on this stock, some of the stove-makers letting go to him, as they could make more money than by making their sheets up into stoves and selling them in the usual way. Whatever there may be to the story, it sounds reasonable, and it is a fact that the country is barren of these sheets now, and a number of concerns are pinched and cramped for material.

New base prices are reported for plate, bars, hoop steel, etc. In a number of cases many warehouses might as well quote any fantastic figure that appeals to them. They have not the material in their stocks, and they have no way of getting it.

The machinery market continues firm, with nothing to show that prices are going to be more reasonable. The sale of small tools and supplies is also reported as quite satisfactory. One order for 400 dozen high speed drills was placed in Toronto by one firm a few days ago. The bulk of the business was secured by an Old Country firm, which was able to put in a price that the Canadian firms would not come down to.

MONTREAL STEEL PRICES CERTAIN TO BE MOVED TO HIGHER LEVELS

Special to CANADIAN MACHINERY.

MONTREAL, January 29.—Combinations of circumstances are reaching the point where prices on steel commodities will require to be still further advanced. The reluctance on the part of producers to depart from the policy of avoiding radical price changes will readily be understood, as any drastic steps in this direction would probably mean a cycle of upward price quotations and labor demands, a condition that would not assist in settling the abnormal unrest that prevails throughout many industries at the present time. Dealers in this district report a steady and continued demand for all lines of steel products, but emphasize the acute situation that exists as regards the supplying of this demand. Despite the fact that the United States steel strike has been declared at an end, the production of the mills is apparently inadequate to meet the present trade requirements.

The cause of this falling off of mill output, it is claimed, is the inability to get sufficient raw materials in the shape of ores, fuel, etc., and inexperienced and efficient help to operate at the capacity which business on the books demand. The car shortage is one of the serious factors that influences mill production as shipments of material are very irregular. In addition to the present increasing demands for steel products it is thought that many developments in trade activity are being deferred on account of the high rate of exchange that must be considered when material is purchased from American mills. The exchange conditions have had the effect of increasing the demand on the Canadian mills, and additional activity in this direction is quite pronounced. The continued cold weather is taxing the railroads in the matter of traffic, and no small amount of the delays in transportation must be laid to this condition. While the market shows no immediate change in price quotations, the apparent perplexity of the entire situation will probably result in higher prices on many commodities. Local warehouses are practically bare of such material as is in general demand.

Steady Tone in Metals

The metal market has quieted down a little from the activity that prevailed last week, and the present tone is one of steadiness, with prices firm. The tin situation is still abnormal and is governed by conditions in London. Quotations may be shaded a little but the nominal price of 70 cents per pound is a fair basis of the prices asked by dealers.

Improvement in Tool Demand

The general belief is prevalent among dealers here that a steady improvement in the demand for machine tools will continue from now on. While there appears to be no pronounced buying from any one quarter, the disposal of equipment, both for tools and supplies, is spread over a wide area, not being confined to localized requirements. Many small machine shops throughout the country have been purchasers of single tools to augment their former equipment. There is little to indicate that the purchaser of a machine tool will be able to obtain the same at a lower cost than now effective for many months to come. As stated last week, some American manufacturers are showing their willingness to shoulder the extra exchange rate to stimulate the placing of orders, although in many instances early delivery is out of the question. Considerable activity is still reported in used equipment, and at good prices.

Steady but Quiet Demand

Little can be said of the old material situation other than that the market is decidedly firm on a quiet demand. There is a light but steady movement in all materials, with a slightly heavier demand for machine cast iron. The nominal prices quoted are subject to revision to suit individual sales.

NEW BASE PRICES ARE SHOWING ADVANCE

Shortage of Material is Cramping Industries—No Relief in Sight at Present

TORONTO.—One of the Toronto jobbers had before him a new price list for U. S. mills this morning. Summarized as to leading items they ran about like this:

Plate, base	3.50
Bars	3.25
Structurals	3.00
Cold Roll Strips	7.25

Roughly, that is an advance of about 90 cents per ton over prices that have been quoted since March 21 last. For some time past the premium business has asked almost any price that good delivery would warrant, but now it is an accepted thing, according to the reports this dealer had received, that these prices are current, and recognized as such.

As a matter of fact, if a person could place business now for plate at 3.50, and be certain of deliveries, he would not be taking much chance. He could make money on the business. Only today one dealer stated that if he could get 200 tons of plate at once he would be willing to pay 75 per cent. above market prices, and moreover he would thank the person who could lead him to the goods.

No Improvement in Sight

It is quite right to state that the steel market is growing worse instead of showing signs of improvement. It may be all right for steel companies to show figures of production, to the effect that they are improving in their output, but the fact of the matter is that the man in Canada who wants to buy steel fails to see where these figures are helping him. His one chance to size up the whole situation is when he goes out to buy. If he can get deliveries he will believe that conditions are improving. If he cannot, it is hard to show him where the improvement comes in, and a good many people are in the latter class at the present moment.

There is some structural material to be had yet, perhaps more of this than anything else, and there is a certain tonnage of heavy plate that can be picked up. But blue and box annealed sheets are the worst off, and there are several shops in Ontario where the scarcity is being felt in a decided way.

Blames the Auto Industry

Here is the explanation that one dealer has to make of the blue annealed material: 'The automobile business is the direct cause of the shortage in blue annealed material. Some months ago they saw there was going to be a shortage in this line, and they knew it was necessary to their business that they should have a supply of this much in advance of what was to be secured in the open market. So they sent out their buyers and cleaned up everything in sight. Why, I know of cases where they went to makers of stoves and paid them a price for their stocks of blue annealed material that would represent a better turnover than if they had made the material into stoves and sold them out to the trade in the usual way. It was a short-sighted piece of business for the stove makers who sold out at that time, for they find now that they cannot get anything more of this line."

POINTS IN WEEK'S MARKETING NOTES

Pittsburgh advices state that the anxiety of buyers to be protected for nearly all lines of steel and iron is becoming more pronounced each week.

—

Advices this week give 3.50 as the current base price on plate at Pittsburgh and other points. The war price was 3.25.

—

Local dealers state that principals are turning down nearly all the business they are forwarding to them now in lines of steel.

—

Dealers in small tools report business as being good and coming from a well-distributed lot of sources.

—

One order for small tools in the Toronto field was for 400 dozen drills. It went to an English company by reason of a close price.

—

Belief is expressed that there may be a runaway market in steel if the companies do not get together. The anti-combine law makes it hard for them to come to any agreement.

Machinery Markets

Although there has not been any very great buying going on, inquiries continue to come in from a well-distributed area. Deliveries are not making any improvement, but there are some firms that are doing better than they promise when the business is placed. It is a matter of satisfaction to the dealer who holds such agencies, as a betterment in a delivery date is a much better factor in securing business than the making of apologies for falling down in the matter.

One Toronto buyer recently returned from making the rounds of the U. S. shops. He reports that production of machines is not as good as before the war. There is a complaint in the shops that the per-man production is down and against that they are paying a much higher wage. The prediction was freely made in several places that the top of the price list had not yet been reached.

The Small Tool Section

Prices remain firm in the small tool and supply market. Reference was made a few issues ago to a large order that was likely to be placed in this district. The business went to an English firm, and was for 400 dozen drills of various sizes. Canadian dealers quoted on the deal, but they refused to give the concessions that were necessary to meet the competition of the Old Country firm, and it is understood that the bulk of the order was placed at a price about ten per cent. below the prevailing market quotations.

Canadian dealers are being called upon now for the first time in some years to meet Old Country competition.

Business in the small tool section is reported as brisk by all the dealers. There is no tendency to shade prices now, and this condition seems to be working out in a very satisfactory way all around.

Prices May Move Up

There are indications that pig iron prices may move beyond their present levels for the last half of 1920. Present quotations in Toronto are about as follows from Canadian stocks:

No. 1 Foundry (silicon 2.25 to 2.75 per cent.)	$47.30
No. 2 Foundry (silicon 1.75 to 2.25 per cent.)	45.95
Standard malleable	47.30

By basing on present Buffalo prices and prices for last half deliveries, it would not be surprising were prices for this district to be:

No. 1 Foundry	$49.45
No. 2 Foundry	48.10
Standard malleable	41.25

LACK OF STABILIZING INFLUENCE MAY BRING RUNAWAY STEEL MARKET

Special to CANADIAN MACHINERY.

PITTSBURGH, Jan. 27.—There is a contrast between the increased anxiety of buyers of pig iron and steel to cover their requirements with price a secondary consideration, and the growing fears of financiers that fundamental conditions are unsound and will grow worse until what they consider a wave of extravagance is checked, either by intelligent and co-operative action in advance or by the stern mandates of economic laws transgressed.

All the evidences of the pig iron and steel markets are of increased strength. Consumers are anxious to buy, to secure protection on their raw materials farther ahead. They are not only willing to pay advanced prices if asked, but are actually bidding prices to producers in hopes of inducing them to loosen up in their sales policies. The producers claim to be conservative and to be desirous of avoiding a runaway market, but it seems rather clear that their refraining so largely from selling is stimulating buyers to put the market up on themselves.

Steel Price Situation

Briefly reviewed, the situation as to

sales of finished steel products is that the United States Steel Corporation has sold at the March 21 or Industrial Board prices for about six months ahead, while few of the independents have sold much tonnage beyond the present quarter. A part of this tonnage sold has been at stiff premiums over the March 21 schedule, but another and considerable part has been at those prices. Thus while the independents do not have nearly as much tonnage on their books at the March 21 prices as has the Steel Corporation, still they do have a considerable tonnage. Some of the independents that have sold only at March 21 prices have made promises to regular customers that they will take care of their tonnages for second quarter, but at prices to be named later, on one date or another in March.

In view of the great pressure for steel products on the part of manufacturing consumers, who see excellent trade ahead of them not only for second quarter, but for a longer time, the steel ought to have been sold to them before this. The reason it has not been sold, except in the case of the Steel Corporation, is that the trade has virtually been without its old time Steel Corporation leadership. The independents used to follow that leadership, but of late they have been, with few exceptions, and now probably with none, unwilling to follow that leadership because it means March 21 steel prices and the independents want more. The independents, however, are unable, on account of the laws, to get together and decide what they do want, hence they have drifted along and buyers become more nervous each day.

A prediction, which seems a pretty fair one in the circumstances, now made is that the independents without any particular collusion will advance to the prices ruling before the March 21 or Industrial Board reductions, which would put the market on the basis obtaining after the first reductions were made from the war control prices. These reductions became effective December 12, 1918, ranging from $4 a net ton on structural shapes and merchant bars to $8 on tin plate, but with no reduction on wire products. The March 21, 1919, reductions were $5 a net ton on wire and wire products and on grooved steel skelp, with $7 on practically all other finished steel products.

Another prediction is that the market will go up to the war control level, passing over both reductions instead of only one. This prediction is not as popular as the other. In each case, however, the talk is that the large independents would stick to the advanced level, once attained, so as to avoid a runaway. A third prediction is that there will be a general runaway, in which case the Steel Corporation would either abandon its policy and follow the runaway or would be in the position of furnishing its steel to regular customers, as far as the production would stretch, at much less prices than the customers could buy at elsewhere.

The case of the smaller independents is not included in the first two predictions. The smaller mills have a way at all times of not selling far ahead, cutting the general market when it is weak, and securing delivery premiums when it is strong and the large mills are sold up several months ahead. Thus there might conceivably be three markets, one on the part of the Steel Corporation at March 21 prices, another on the part of the larger independents at January, 1919, or war-control prices, and still another at a wide range of premium prices for particularly early deliveries.

Demand Prospects

The common view is that there will be an unlimited demand for steel for several quarters to come, i.e., a demand clearly in excess of the supply, whatever that may be. Unquestionably this conclusion is premature, and the fact that it is so almost universally held does not confirm the view but rather makes it the part of wisdom not to accept it as a finality. Those who hold the view, when questioned, are found to hold it either because they find everybody else holds it, for no better reason than they themselves, or hold it because they find buyers so importunate in seeking to buy. As to this phase, the condition may be due to the extreme reserve of the independents in selling, due to their having renounced Steel Corporation leadership and thus being without leadership, and the necessary reserve of the Steel Corporation because it will not sell more than it can produce and must apportion that tonnage to regular customers.

If the prospective demand for steel be scrutinized from the viewpoint of prospective consumption operations rather than from the viewpoint of the importunities of buyers—which may be only a sort of "hearsay" evidence—the prospects for large consumption are found to be not necessarily so clear. Much is being said about large purchases the railroad companies are going to make after their lines are returned to them March 1, but railroad officials do not talk that way. They express concern as to where they are to get money, and money first for refunding maturing obligations, not for making additional expenditures. As to new construction, of buildings, factories, bridges, etc., into which normally a large proportion of the steel output flows, there is complaint everywhere of labor being very scarce and of construction costs being extremely high. There will undoubtedly be altogether as much building of one sort or another as there is labor supply but there is no distinct outlook of there being a great volume of building of the character that consumes large quantities of steel. For illustration, offices are extremely scarce in Pittsburgh and a few days ago B. F. Jones, Jr., bought the Monongahela House, a large brick building erected 80 years ago and for several decades the leading hostelry in Pittsburgh. There is no thought of rebuilding, however, the intention being simply to convert the old hotel into office rooms. Again, it is just announced that the Mellon Bank, which years ago acquired the various parcels of real estate making up what is one of the very best sites in Pittsburgh, facing three good streets, is about to go ahead with its building project, but it is understood it will erect simply a three-storey bank building, not a sky-scraper, even though space in office buildings is renting at 50 to 100 per cent. above the rates of five years ago.

The common view may be right, but this is a time when the majority may be wrong, and the individual will do well to consult also his own judgment.

U.S. SCRAP METAL

There has been a strong market for scrap material, heavy melting steel selling particularly well. Total sales of this grade were over 50,000 tons. Following are reports from various U. S. centres:

PHILADELPHIA.—Steel scrap sold in large quantities at $25 delivered, the largest buyers being the Bethlehem Steel Co. and the Lukens Steel Co. There is a good demand for all grades of scrap material, cast scrap being most in demand.

NEW YORK. — There has been an active market here, and prices have advanced. Heavy melting steel has been the most in favor, sales amounting to over 70,000 tons. The price of this material is $20.50 to $21, f.o.b. New York. Heavy cast scrap has advanced about $1.

PITTSBURGH.—Heavy melting steel is being quoted pretty generally at $28, and a small tonnage has been sold at this figure. The market for steel making grades is very strong. A small lot of baled sheet scrap was sold at $24, and bundled sheets have brought $20.

BUFFALO.—There is a strong market here, with good enquiries for all grades of material. Enquiries for heavy melting steel aggregate 25,000 tons. Heavy melting remains around $25 to $26, although $27 has been asked by Youngstown for delivery to this district.

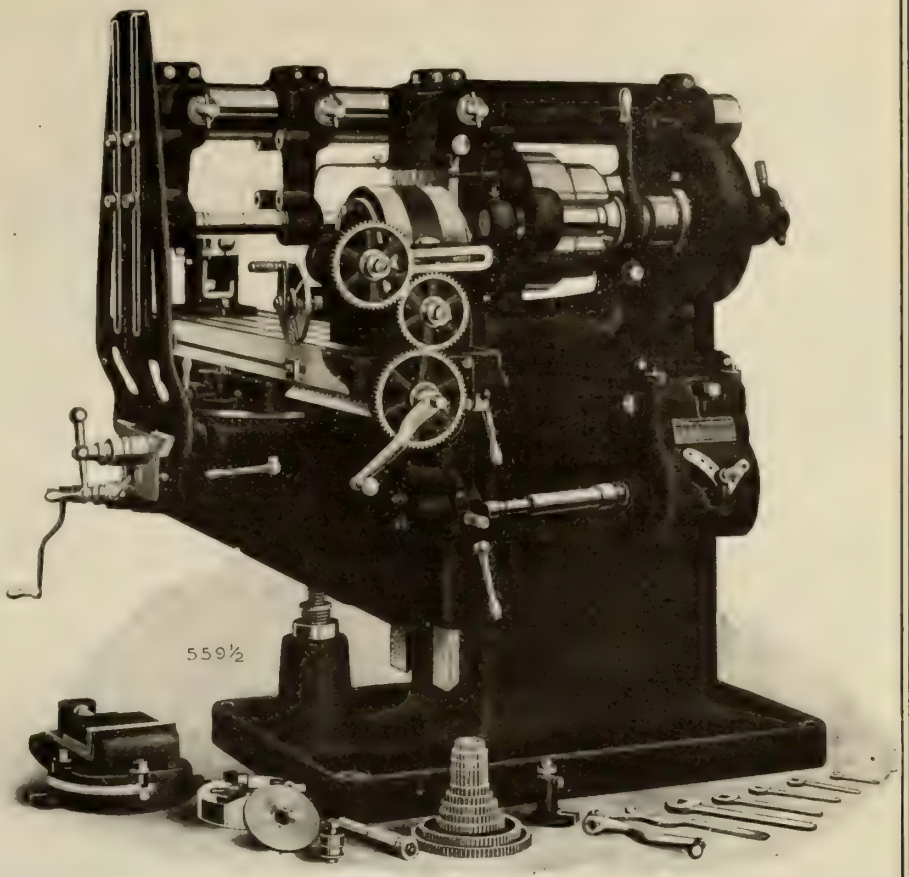
CLEVELAND.—While both cast scrap and heavy melting are strong, cast scrap has taken the lead. Heavy melting has advanced to $26 and $27, while No. 1 cast has sold as high as $38 per gross ton, and heavy cast $26. Other grades are about the same prices as last week.

CHICAGO.—Cast scrap is in strong demand by foundries, and is generally quoted at $42.50 per gross ton. Steel grades have declined somewhat, due to short selling by dealers. There is very little chance of any general reduction.

ST. LOUIS.—Good demand with heavy buying, caused an advance in most grades of scrap material during the week. Railroad wrought is now quoted at $28 to $28.50, iron rails at $30 to $30.50 and care wheels $33.50 to $34. The Lacled Steel Co. bought 10,000 tons of re-rolling rails.

CINCINNATI. — There is a strong market, with plenty of enquiries, but not a great deal of actual business. There is not much material held in stock, and this is not increasing.

LeBLOND
HEAVY DUTY
Universal Millers



Are not only Tool Room Machines, but as a manufacturing proposition appeal to the careful buyer.

Their long life insures ample returns for the investment made.

May we explain to you their many advantages and the convenience of their control.

The Week's Events in Montreal Industry

R. Duguid has resigned from the position of manager of the Tidewater Shipbuilders, Limited. Pending the appointment of a new manager, the duties of the office will be taken over by the president, A. A. Wright.

Everything is in readiness for the big annual business and professional meeting of the Engineer Institute of Canada. Every effort has been made to make this the most successful, both socially and from a business standpoint, in the history of the organization.

Five workmen of the Hall Engineering Company, of Montreal, were slightly injured while repairing a boiler at the Low Level pumping station, when a tube on an adjoining boiler burst, enclouding them in steam. Little damage was done to the plant, but the burns of the men were painful, but not of a serious character.

The reported illness of Graham Drinkwater, vice-president of the Canadian Fairbanks-Morse Company, of Montreal, has caused no little anxiety in business circles in this city. While on a trip to New York, prior to taking an extended holiday tour in the Mediterranean, he contracted a severe cold that developed into pneumonia, from which, however, he has partly recovered. The sea voyage will likely be postponed or deferred, and Mr. Drinkwater and his wife will journey to South Carolina, where they will spend several weeks, to enable Mr. Drinkwater to recuperate after his recent illness.

At a meeting of the Canadian West Indian League, held last week at the Windsor Hotel, Montreal, at which Frank H. Keefer, Parliamentary Under-Secretary of State for External Affairs, was the guest of honor, a resolution was passed by those present, in which the Government would be urged to appoint a commission that would confer with the various Governments of the West Indian colonies with a view of helpful co-operation for the extension of trade between the two countries. Many of the members felt that the time was very opportune for stimulating of production of Canadian goods for export to these colonies. Canada is at present a heavy buyer of West Indian products, but a very large percentage of the total comes to this country through United States channels, and it is the hope of the League that a considerable amount of this trade can be carried on direct.

The Motor Show just closed in Montreal has been the most successful yet held by the Automobile Association. It is estimated that approximately 100,000 people visited the Motordrome during the week the show was in progress. Every available foot of space was occupied on the three floors of the large building, and 128 dealers, many of whom represented four or five different makes of cars or accessories, were kept extremely busy throughout the entire period in telling of the many merits of their various lines. The farmers, in particular, were especially interested in the farm trucks and tractors, and they fully realized the economic value of this class of equipment for general rural purposes. The appreciation of the public for the splendid exhibit and the all-round success of the show has so impressed the officials that the prospects of a better and bigger exposition for next year will induce the management to extend it for a longer period.

George Hadrill, who, for the past 34 years, has been the active secretary of the Montreal Board of Trade, and who has been associated with that body for a total of 43 years, has resigned from the position he has so efficiently filled for so many years. His services will be retained in the capacity of "secretary emeritus," while the active duties of the office will be taken over by J. Stanley Cook, who has acted as assistant secretary for the past 22 years. Mr. Cook has been carrying the bulk of the burden for several years back, and has the full confidence and respect of every member of the Board.

Compensation, to the amount of $2,000,000, has been paid to Sir Charles Ross for the Ross rifle factory. With the settlement of this claim, Sir Charles retires from a position recognized as exclusive purveyor of rifles for Canada's military forces. The amount handed over was paid out of the war appropriation vote of last session. What plans the Government have respecting the disposal of the factory have not been made public, but as the plant is fully equipped with the most modern equipment, it is expected that it will be ultimately utilized as a permanent plant for the manufacture of instruments for national defence.

Announcement has been made by officials of the Canada Steamship Lines, general agents for the Fracanda Line, that a new service will be inaugurated on February 24, between Canada and the port of Bordeaux. Winter sailings will take place from St. John, N.B., but vessels will come up the river to Montreal during the summer season. The success that has been attained by the previously established trade service between Canada and Havre has been an influencing factor in this latest step of the company. In speaking of the new service, Mr. Doherty, general traffic manager of the Fracanda Line, said: "Importers and exporters should benefit greatly by this service, as the port of Bordeaux serves a section of France not conveniently reached through Havre or other northern ports. The establishment of our Havre service was the result of our faith in the future trade relations between Canada and France, which we realized could be developed only through direct steamship connections. Our faith in the service of this venture has been fully justified and the support extended us has encouraged us to extend our field by a direct service to Bordeaux. Early indications point to liberal patronage of the new line from the start and the likelihood of our being justified in the very near future in increasing the sailings to two steamers monthly."

PIG IRON TRADE

There have been heavy sales of pig iron for last half delivery. Basic also has had some big sales and has advanced in price. Following are reports from U. S. points:

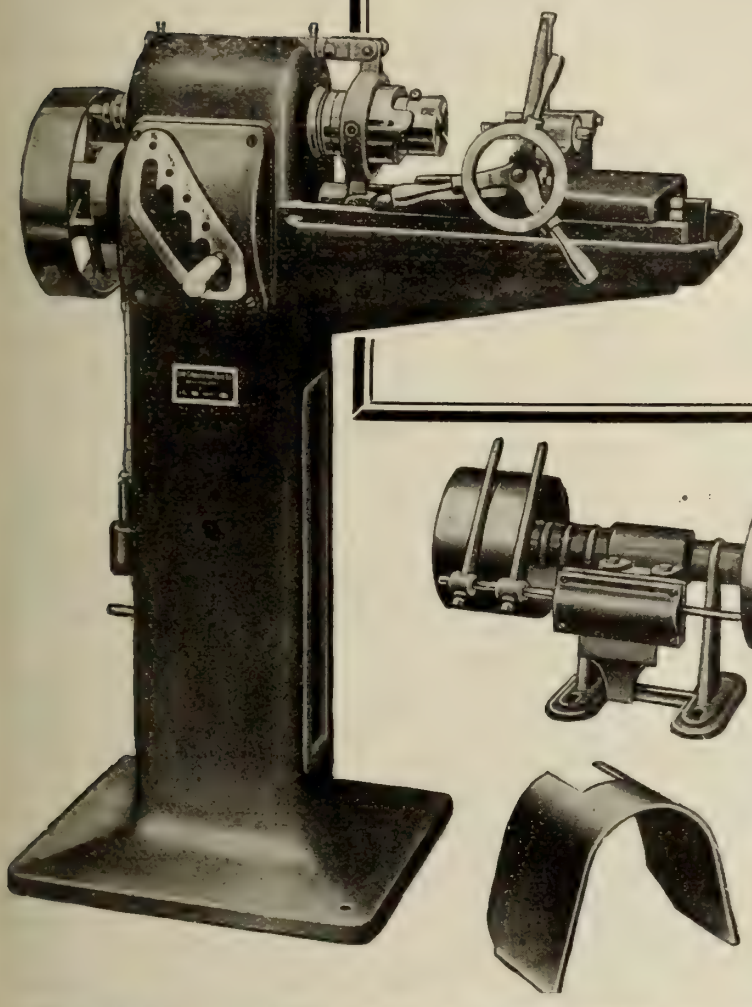
CLEVELAND.—Pig iron tonnage for last half delivery has been large, and the prevailing price has been $40 for 1.75 to 2.25 silicon. 2,000 tons of malleable was sold at $40.50, and some sales of this grade have been made at $41.50 furnace. Between 40,000 and 50,000 tons basic has been sold in this district at $40 valley furnace.

PHILADELPHIA.—No. 2 iron for second half is generally quoted at $42 Eastern Pennsylvania furnace, with $43 for 2.25 to 2.75 silicon. However, competition on this business and particularly for third quarter has been keen, and some selling has been done at $1 less than the prevailing price.

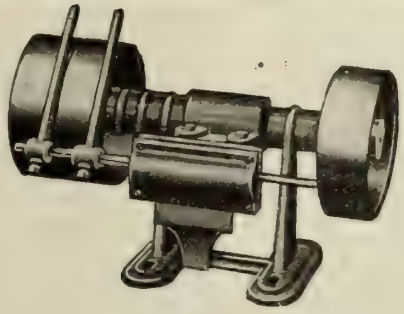
NEW YORK.—Good business has been done in this district for second half, and the total will be about 70,000 tons. The grades included both foundry and steelmaking, and some of it was for export. Enquiries are on the market for over 75,000 tons, foundry, malleable and steelmaking grades.

PITTSBURGH. — Business has been comparatively quiet this week. The biggest enquiry has been for 12,000 tons basic for export. Quotations for basic are around $40 valley furnace. 1.75 to 2 25 silicon is also bringing $40 furnace, although some business has been done at $41.

CINCINNATI.—There is not much iron available in this district, and the demand is increasing. There is no iron to be had for less than $40, either for first half or first quarter of second half, and in some cases $41 has been secured.



THE GEOMETRIC WAY



Where quantity and exactness have to be considered, the Geometric Threading Machine is just the way that suits. These machines have been tested and proved over and over again on speed, accuracy and endurance.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut ⅛ to ½ inch, ¼ to ¾ inch, and ¾ to 1½ inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.

A line from you brings full details regarding this machine. Tell us your threading requirements — let us recommend the proper Geometric Collapsing Tap or Self-opening Die.

The Conradson Machine Tool Co.

Green Bay, Wisconsin

Take pleasure in announcing an association of interests in the manufacture and sale of the new line of "Ryerson-Conradson" Machine Tools.

Mr. C. M. Conradson, President of the Conradson Machine Tool Co., and of national reputation, is the inventor and designer of the line of Plain and Universal Milling Machines, Selective Head Lathes, Planers and Radial Drills.

Joseph T. Ryerson & Son are enlarging their machinery organization, which now includes plants in Chicago, St. Louis, Detroit, Buffalo and New York, offices in the larger American cities and agents and direct representatives throughout the world.

The Dawn of Economy and Speed in Tapping

Aikenhead's Wahlstrom Tapping Attachment has the oscillating movement which mechanically imitates hand-tapping, though ten times faster and reduces tap breakage to a minimum.

Takes taps of all sizes from 5-40 to ½ inch standard. Powerful, durable, foolproof, There's nothing to get out of order.

May we send one for 10 days' trial? Return it if not satisfactory.

Has Two Movements

Oscillating for hard material — continuous revolution for soft material. Tap reverses when spindle is raised.

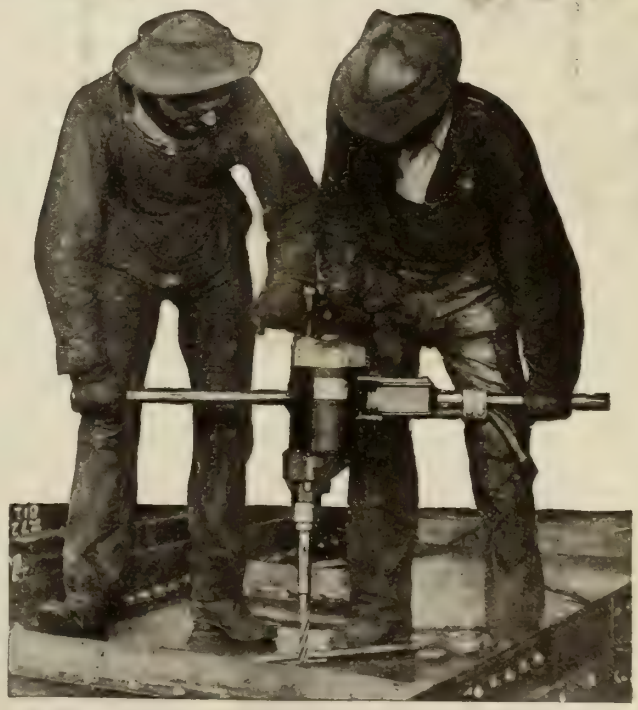
Fits Any Drill Press

Aikenhead Hardware, Limited

17 Temperance Street, Toronto, Ont.

Aikenhead's VAN DORN ELECTRIC PORTABLE DRILLS

Drill Faster



Van Dorn Electric Drills make neat, clean holes 50% faster than the best pneumatic drills.

Drill Cleaner

If you have holes to drill in wood, steel, any metal — Van Dorn Electric Drills can drill them for you at lessened cost.

Van Dorn Drills are both fool-proof and trouble-proof. ASK THE USER.

May we send catalogue?

Big Business Chances in Japanese Market

Canadians Who Have Anything to Sell Should Look Into This Market—Should Send Best Men Who Thoroughly Understand the Lines They Are Representing

VANCOUVER.—C. D. Strong, Tokyo buyer for the United Paper Products, Vancouver, has great hopes of the amount of business that can be done with Japan. Mr. Strong is intimately acquainted with the Japanese market, having spent about nine months of every year in Japan for the past seven years. Speaking to a representative of CANADIAN MACHINERY, Mr. Strong said:

"I want to tell you," said Mr. Strong, "that it would break a Canadian's heart to see all the business that can be done in that country, and what a poor effort is being made to capture any of it. I only ran across one Canadian business man over there selling goods, for a good many months. That was an elderly gentleman from Hamilton selling steel, and I believe he was doing good business, too. But there's an immense demand right now for hundreds of the things that are being made in Ontario. There's a great market for pulp mill machinery and scores of other kinds of machinery, such as was being made at Brantford, Hamilton, Waterloo and all the other manufacturing centres. There are thousands of tons of nails alone shipped into Japan, and I don't see any one even reminding the Japanese trade that Canada can make such an article.

"If you don't do another thing," he said to your representative, "tell the Canadian manufacturer that he'll never sell many goods in this market until he sends his own man over here to sell the goods. There will never be a success made of merchandising Canadian goods if an agent is left to do it. The ones that are making the greatest success of selling their goods in Japan, from the United States, send a smart, aggressive, well-posted salesman out to Japan; one who knows his goods thoroughly and who can not only sell the line, but operate it, and teach others to do the same (I refer to mechanical lines). Heinz and Libby and Getz Bros., of 'Frisco, are selling immense quantities of canned goods in Japan. They sent over their salesmen to put their goods on the market, and they keep a staff over there to see that they "stay put" on the market. I haven't been able to buy "Quaker" brands of vegetables or fruits, or Clark's Pork and Beans, or any other Canadian line. Why? Japan is very proud of her relations with Great Britain, and Canada means Great Britain over there—there would be a good hearing for a Canadian salesman on canned goods there. Canadian pulp is being shipped in great quantities to Japan, but the mills should have their resident salesman right on the ground all the time. The same is true of lumber. The American typewriter, cash register, and adding machine people get right into the interior of China and Japan and they keep salesmen right in the field.

"If our Canadian manufacturers want to sell machinery in Japan, and there's a market for almost any kind, and lots of money to pay for it, they must send their best informed salesmen, and an expert mechanic to instal and operate the same. The Japanese merchant will pay, and pay well, to have the whole installation in perfect working order, and his staff trained to operate.

"Let me say right here," Mr. Strong continued, "that having the language is a great help to the salesman in Japan; if I were going to send a good man into that territory to sell my goods, I should have him take six months' lessons on the language here before he went; I understand that many of these languages are now taught in connection with the business colleges; and even the rudimentary knowledge of Japanese so gained, would be a great asset on arrival. I don't say that it is absolutely imperative that the salesman speak Japanese, but it is a great advantage; you can get very much closer to your prospect in his own tongue. It is surprising that there are no great American or Canadian export and import houses in Japan. Those who are buying in Japan and have a staff there for that purpose do not sell; nor do those selling there buy; even the largest American company operating in Japan sells only.

"The manufacturing of Japan is mostly done in a small way; it is a small man proposition. There are, of course, big factories but a great many of the articles exported are made in practically what might be called a home factory. A man and his wife will have a little work shop and turn out only one or two little articles; and have made these articles all their lives.

"Most of my purchasing is done from a multitude of these little fellows (else the middleman's profit), and you can readily see that my knowledge of their language is invaluable to me. Often I will sit and chat and drink tea for a couple of hours before I can find out just what that particular chap manufactures. He will never produce samples or urge purchase at casual acquaintance. The language gives you the personal touch which facilitates business and confidence the world over.

"Another thing we need to build up a big business with the Orient is boats; Canadian boats that will always give the Canadian cargo the first consideration. The C. P. R. boats are splendid and have done a great deal to help Canadian trade with the Orient. In understand that they are putting some more and bigger boats on the Pacific run.

"I expect to go back about the twentieth." said Mr. Strong. "I've only had a month home, this time, but business is very big in the Orient just now. I do hope that many Canadian manufacturer will jump into their opportunity now i: that Oriental market. I hope they'll at tend personally to the pushing of thei individual lines there; will study th British way of packing, and make Can ada's export business flourish; that's th way to pay the debts."

NEW LINES PLANNED FOR SHERBROOKE NOW

Ingersoll-Rand Make New Connections—May Have Pulp Mill Erected There

The Canadian Ingersoll-Rand Co., Ltd., 260 St. James Street, Montreal, Canada, have concluded arrangements with the Wellman-Seaver-Morgan Company, of Cleveland, Ohio, and are now manufacturing and selling in Canada W-S-M hydraulic turbines and rubber machinery, which comprises: rubber calenders, tire-applying presses, rimming presses, hydraulic press vulcanizers, washers, crackers, mixing rolls, moulds, cores, etc.

This firm have also been appointed Canadian agents for and manufacturers of the Bird Machine Company's line of pulp and paper mill specialties, which comprises Bird inward flow rotary screens, Walpole screens, continuous beating attachments, save-alls, etc., and the Ryther and Pringle Company's slasher and swing saw systems, kickers, loaders, log haul-ups, conveyors, chip screens, splitters, shredders, and other wood preparing machinery, as well as the Barrienger braking device for skidding large logs or lowering heavily-loaded sleighs or other vehicles down steep grades.

The Sherbrooke plant of the E. & T. Fairbanks Company starts running on an eight-hour basis next week. The office force has been working 7½ hours for some time and the shop is now going on to the eight-hour basis so as to be in line with the practice at the St. Johnsbury plant of this company.

B. C. Howard, of B. C. Howard & Company, plans to erect a pulp mill here providing the necessary electric power can be obtained. It is said that this mill will be located a short distance below the junction of the St. Francis and Magog Rivers and within easy reach of the Grand Trunk tracks.

Using a revolving knife, a new bread slicing machine cuts even the thinnest slices without crushing a loaf.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Credit for Machinery.—The War Finance Corporation, Washington, D C., has announced further credits for machinery. The amount is $10,000,000 and the machinery is to be exported to England, France, Belgium and Italy.

Direct Route to West Africa.—With a view to opening up a direct service from the West Coast of Africa to the Dominion, Mr. A. E. Cook, of the Elder-Dempster Company, Montreal, has sailed for England to take up the question with the head office of the firm in Liverpool.

New Company in Welland.—The Marvel Company of Welland has been incorporated and will carry on the business of manufacturing and dealing in automobiles and accessories of every description. They will manufacture the "Marvel" steering device for Ford cars and deal in light, heat and power.

Busy Brantford Firm.—The John H. Hall & Sons Co., Ltd., Brantford, speaking to CANADIAN MACHINERY this week, stated: "This firm has more pipe-threading machinery on order than at any other time in its history, and the number of inquiries received indicate that the year 1920 will be the best yet."

Machinery for Brantford.—A large amount of machinery is being shipped into Brantford from across the line, regardless of the adverse exchange rate. The newest company, the Bluebird Manufacturing Company, which has taken over the premises of the Motor Truck Co., has already started work in the tool-room.

Toronto's New Industries.—Through the efforts of the Toronto Industrial Department there has been brought to the city since March last twenty-five new industries. Most of these are branches of American factories which are establishing themselves here. The establishing of two of these firms alone will mean the retaining in Canada of from $3,000,000 to $4,000,000 per annum.

Looking for Rolling Stock.—The Belgian Minister of Railways is in London, Eng., negotiating through the Dominion Government representatives there for the purchase of fifty locomotives and three thousand cars from Canadian manufacturers. The contract will be signed as soon as the Minister of Finance consents to an advance of credit. Belgium has an unused balance from last year's credit, of which she only availed herself to the extent of $11,000,000, the total being $25,000,000. She expects to get credit now of $10,000,000.

International Waterway Committee.—A meeting of the Canadian Deep Waterways and Power Association and officials of the Great Lakes, St. Lawrence and Tidewaters Association, took place at the Detroit Board of Commerce recently. Representing the Canadian Association were O. E. Fleming and Major Alex. C. Lewis, while H. P. Gardiner and C. P. Craig represented the United States organization.

Montreal.—Mr. Robert Reford of the company of that name, says that oil burning vessels will soon be on the Montreal route.

HAVE JOINT SHOP COMMITTEE AT ROBB ENGINEERING WORKS, LTD.

The Robb Engineering Works, Limited, Amherst, N.S., have in operation an Industrial Council, which they call the "Joint Shop Committee," and which is working out in a very satisfactory manner.

An official of the firm outlined the project to CANADIAN MACHINERY as follows:

The membership of Robb Engineering Works' Joint Committee shall consist of a number of members appointed by the workmen of the Robb Engineering Works, Ltd., and an equal number of members appointed by the management.

The objects are as follows:

(a) That the workmen in the Robb Engineering Works be given a wider interest in and a greater responsibility for the conditions under which their work is performed.

(b) The settlement of general principles governing the conditions of employment, including the methods of paying and re-adjusting wages, having regard to the need for securing to the workmen a share in the increased prosperity of the industry.

(c) The establishment of regular methods of settling differences between employers and workmen and to their better adjustment when they appear.

(d) Better utilization of the practical knowledge and experience of the workmen.

(e) Improvements of processes, machinery and organization.

(f) Technical education and training.

(g) Consideration of sanitary conditions and the study of comfort for workmen.

(h) The institution of safety committees for the introduction of safety devices and methods.

(i) Robb Engineering Works Relief Society Organization.

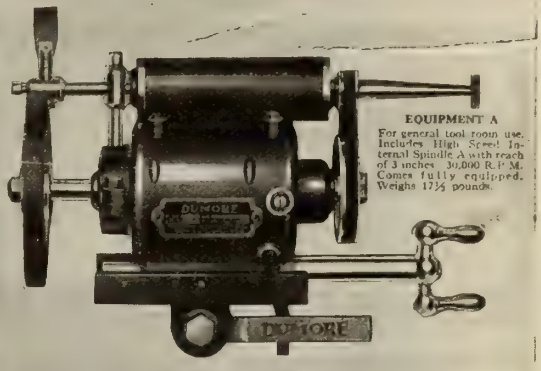
TRACTOR COMPANY IN THE MARKET FOR A LONG LIST OF MATERIAL

The Franklin Tractor Company, Greenville, Ohio, announce that they are in the market for the following material for delivery in 1920, commencing March 1: 750 30 h.p. 4-cylinder tractor motors; 750 magnetos; 750 sets of radiator cores; 1,500 rear sprockets (steel castings); 1,500 front sprockets (steel castings); 4,500 track rollers (grey iron castings); 1,500 upper track roller idlers (grey iron castings); 4,000 brackets (grey iron castings); 750 gasoline tanks (Armco iron or equivalent); 750 gasoline tank pedestals (grey iron castings); 750 steering wheels; 750 spring seats or equivalent; 7,000 lineal feet steel angle 4.4 pounds; 7,000 lineal feet steel channel 5 pounds; 2,000 sheets (blue annealed Armco iron or equivalent); 100 tons cold-rolled rounds, 1 in. to 3 in. diameter; 750 complete sets transmission gears; 750 pressed, split steel pulleys, or 750 power take-off systems complete; 750 transmission housings (grey iron castings); 750 clutches; 60,000 steel treads for crawler type tractor; 750 radiator filler caps; 750 radiator cases (grey iron castings; 750 motor fans and belts; 750 liquid steel castings); 155,250 bearings; 750 complete rear systems; 750 front axles (steel castings; 155,250 bearings; 750 carburetors; 750 governors. Miscellaneous castings and forgings.

In addition to the above we shall be in the market for lathes, boring mills, shapers, presses, drill presses, power saws, and other necessary material and equipment.

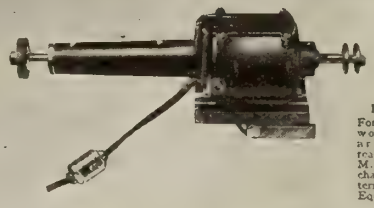
In analyzing your shop costs have you considered a possible saving in your tool room?

How Many Prices Are You Paying for Making Your Tools?



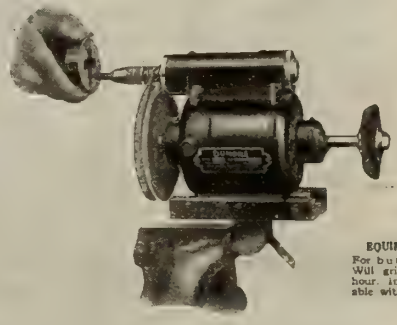
An analysis of the operation of departments from a "dollars and cents" point of view, and particularly those departments directly affecting production, invariably discloses abnormal costs.

One sure means of reducing costs and, at the same time, of obtaining highest quality tools, is found in the **DUMORE** portable grinder. The two chief reasons for this are **balance** and **speed.** The perfect running balance eliminates vibration and chatter—the big range of speeds from 10,000 to 50,000 R. P. M. gives even the small wheels the correct cutting speed, thus insuring work free from taper or bell-mouth. In addition to these reasons, the **DUMORE** is portable, permitting the mechanic to carry it to the many jobs being constantly set up in all parts of the shop.



Your dealer sells **DUMORE** grinders. Ask him for a demonstration.

WISCONSIN ELECTRIC CO.



2919 16th Street RACINE, WIS.

EQUIPMENT A
For general tool room use. Includes High Speed Internal Spindle A with reach of 3 inches 30,000 R. P. M. Comes fully equipped. Weighs 17½ pounds.

EQUIPMENT B
For deep internal work. Extension arm has 10-inch reach. 10,000 R.P. M. Arm interchangeable with internal spindle on Equipment A.

EQUIPMENT C
For button dies. Will grind 20 an hour. Interchangeable with A and B.

treal to London service, would be resumed just as soon as the new ships being built became available. There are six of these vessels on the stocks, and it is hoped that some of them at least will be available for next season. They will all be oil burners.

Baldwin's Place Orders.—A large amount of new equipment has been ordered in the United States by the Baldwin Canadian Steel Corporation, who are building their new plant on the land of the Eastern Harbor Terminals in Toronto. This is the site formerly occupied by the British Forgings, Ltd. The material ordered consists of tinning units, conveyors and cleaning machines, and the order has been placed with an Ohio company.

Second Writ Issued.—A second writ has been issued by the United States Government for the recovery of 11,000 tons of steel forgings, and a number of motors, power transformers, machine tools, etc. The goods are situated on a piece of property north of the Buffalo and Lake Huron branch of the Grand Trunk Railway at Brantford. The writ is endorsed with the statement that the United States has sufficient assets to cover the costs of both parties, situated in the Province of Ontario.

Doubling Output.—Jenkins Bros., Montreal, are making an addition to their plant. The new building will be one storey, steel and brick construction, with crane way and monitor; 80 ft. wide by 192 ft. in length. The contract price is approximately $40,000. This building will be used as a machine shop, and taken in conjunction with the addition to prevent foundry building and new core room, which is already completed, will increase Jenkins Bros.' output of valves about 100 per cent.

New Industry in Brantford.—Plant No. 1 of the Motor Trucks, Ltd., has been secured by the Bluebird Manufacturing Co. of St. Louis, and the officials of the company expect to be in a position to secure production in about three months. Considerable capital has been subscribed by Brantford men, and the directorate of the new company will be practically the same as that of Motor Trucks, Ltd. The names of these gentlemen are J. B. Detwiller, R. E. Secord, W. J. Verity, W. C. Boddy, and T. Hendry.

To Survey Western Industries.—G. M. Ponton, assistant secretary and technical adviser of the Canadian Trade Commission, has left for a tour of the Western Provinces. Mr. Ponton will make a survey of the industries now operating and suggest means of increasing their operations. He will also examine the cases of industries which have had a brief existence, and are now shut down, with a view to ascertaining if they have a prospect of success if resuscitated. He will also enquire into the advisability of establishing new industries in the West, depending on natural resources and general conditions of trade.

Ontario Iron Shipments.—The Government report for the output of mines during 1918 is now available. During this year the Ontario mines shipped 198,883 tons of iron ore, 91,069 tons of which were shipped to Ontario smelters, the remainder being shipped to the United States. The chief producers were the Algoma Steel Corporation from their mines in the Michipicoten district, and the Moose Mountain Ltd., at Sellwood, near Sudbury. Three hundred and forty-five tons were shipped by the Pee Mining Co., Frontenac Co., and 80 tons by the Canadian Union Mines Corporation, Drummond. Ontario blast furnaces smelted 100,000 tons of Ontario ore and 1,375,459 tons of U. S. ore during 1918.

MARINE

Liverpool.—Famous names will be perpetuated by the Cunard Company, who will name their new ships after others formerly in the line. They will pursue this policy naming twelve big passenger ships now building. Four vessels of the 600-foot class now under construction will be named Scotia, Franconia, Laconia and Samaria.

St. John, N.B.—The St. John Board of Trade has issued figures covering the year 1919, showing the movement of goods through the port. Exports were

STAR GAP LATHES

The Seneca Falls Manufacturing Company, Inc., Seneca Falls, N. Y., have just brought out two sizes of Gap Lathes 11 in. x 18 in. swing and 13 in. x 21 in. swing. In designing the "Star" Gap Lathes, the extra capacity feature of the "Gap" has been added to the quality, convenience and efficiency of the well-known "Star" Screw Cutting Lathes.

The bed is of the box section type, thoroughly braced by cross webs and made very heavy through the Gap section to insure usual "Star" Lathe accuracy. A bridge piece is furnished to close up the Gap when the extra swing of the Gap is not needed. Beds are made 5, 6, 7, 8, 10 ft. long.

The carriage has the cross slide placed at left hand for convenience. The cross feed screw is supplied with micrometer collar graduated in thousandths of an inch. The apron has safety device so that longitudinal feed and split nut cannot be engaged at the same time. Has extremely wide range for screw cutting all standard threads from 3 to 72, including 11½ and 27 pipe threads. Can be equipped with transposing gears or metric pitch lead screw for cutting metric threads.

An unusually large line of attachments, including raising block, quick change gears, taper attachment, motor drive, draw-in chuck, milling and gear cutting attachment, turrets, relieving attachment, etc., may be used on the "Star" Gap Lathes.

There is a danger in riveting steam boilers by hydraulic pressure, that the pressure on the cup may be released before the shank of the rivet has had time to cool. In such an event the plates may spring apart to such an extent, that the shrinkage of the rivet in cooling is not sufficient to ensure a tight seam. In a German technical paper a description was recently published of an autographic recorder designed to overcome this possible defect of hydraulic riveting. Pressure upon the warm head of the rivet is transmitted through piping to clockwork and sets a pointer in motion until the required pressure is reached. This pressure is kept constant until a predetermined number of seconds has passed, when a red pointer indicates that the pressure may be released, and the pointer returns to zero. This result is graphically recorded upon a travelling paper band, from which the pressure and the period of compression can easily be read.

\$149,986,167; imports, \$15,702,446; grain exports 1918-1919 were 16,295,373 bushels, valued at \$33,014,536; customs receipts 1918-1919, \$3,244,424. The tonnage of vessels entered in 1919, 1,239,280 register; number of vessels, 2,130; vessels cleared 2,090; register tonnage, 1,204,011.

TENDERS

The Department of Public Highways are calling for tenders, up to February 2nd, for the supply of road building equipment: Two three-quarter yard steam shovels, forty railway breaker

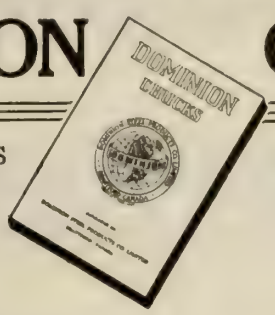
NEW USES FOR OLD THINGS

Slicing Cucumbers

We don't guarantee success and would like to know what luck others have before we try it on ours.—"The Exciter," house organ of the Central Marine Power Company.



In a paper on the subject of quenching oils for forgings, held by the American Drop Forge Association, Mr. G. W. Pressell said that the water quenching of large forgings was very sharp and severe, and if not properly handled often resulted in the failure of the piece after working. The quenching of forgings in oil was fool-proof, and the expenditure of money required properly to equip the hardening department with tanks and cooling systems was fully warranted. The ideal quenching medium for forgings would be a water soluble material which, when mixed with water, would give a quenching speed through the critical range equivalent to that obtained with water, and from the critical range to the atmospheric temperature equivalent to that with oil. A mixture of oil and water had, nevertheless, proved unsuccessful. Spreading a small quantity of oil on the surface of water used for quenching to reduce the sharp effect of water alone had also been tried, but without success.

A novel use for balloons has been developed in California, where one is being used for hoisting tent-like covers over citrus trees which have to be fumigated. The balloon has a capacity of 3,000 cubic feet and takes the place of a high travelling derrick, which was liable to damage the trees while being moved about the orchards. The balloon and a crew of four men place between twenty-five and thirty tents an hour over large Valencia trees. The derrick outfit with seven men places but fourteen or fifteen tents an hour.

The Swedish state railways are planning to electrify the line between Stockholm and Goteborg at a cost exceeding $16,000,000 and requiring more than three years of work.

QUALITY

The Problem Solved!

Dependable quality in abrasive wheels is next to impossible unless the manufacturer commands his own raw material supply. Inability to do this has always stood against dependability in Canadian wheels.

We have solved the problem by making our own abrasives, and we are now prepared to guarantee that DOMINION WHEELS will give equal service to the best imported wheels.

There's a Dominion Wheel for every grinding requirement. They are made by expert workmen and every step in the process of manufacture is carefully inspected to insure a STANDARD QUALITY when the wheel leaves the Dominion factory.

Have you any grinding problems? We have had long and varied experience and can give you valuable assistance.

Clean, *Accurate* Threads —in half the time!

Don't let big production demands make you forget that the threads you turn out must be standard, must be clean, must be within prescribed limits of size.

MURCHEY COLLAPSING TAPS and SELF-OPENING DIE

are tools that give big production without sacrificing accuracy. That's why Murchey production is different. Murchey tools have an unexcelled production record; and they produce accurate work because they clear the thread instantly when opened, with no danger of stripping.
We are prepared to send you a Murchey tool on approval, to try out on your work. Take advantage of this to-day.

Murchey Machine & Tool Company, Detroit, Mich.

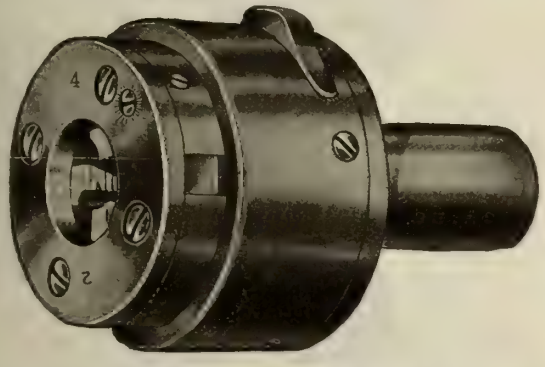
Which?

CLINTON CEMENT

FIRE clay dries up and sifts out from between the bricks like powder, causing the escape of hot air and interfering with proper combustion by cold air leakage.



Clinton Cement Saves Fuel and Increases Boiler Furnace Efficiency

It makes joints that stay tight. Sets and makes a surface like glass yet allowing for expansion and contraction. Stands a heat up to 3,000 degrees Fahrenheit.

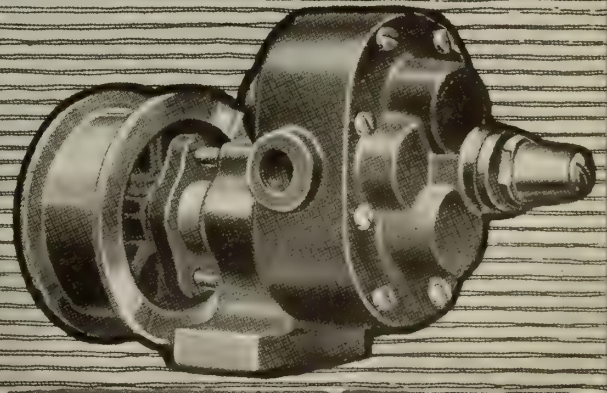
Try it once and you always want it.

A five-pound tin of **Clinton Super-Heat Cement** will be sent you free and all charges prepaid, if you write the

Standard Machinery & Supplies Limited
261 Notre Dame St. West, Montreal

H & G **Die Heads**

are of small outside diameter compared with the size of work they do.



The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

A Little Act of Courtesy That is Good Business

BY simply mentioning CANADIAN MACHINERY when writing to our advertisers you will be doing something which will prove of three-fold benefit.

First—It will benefit you because it enables the advertiser to immediately associate your enquiry with the product advertised, resulting frequently in quicker service.

Second—It will benefit the advertiser because it enables him to identify and classify enquiries and to give credit where credit is due.

Third—It will benefit **your** paper because in the records of the advertiser it will receive the credit for your enquiry, instead, perhaps, of some less deserving medium.

We are always grateful for favors of this kind. It costs the reader nothing, and yet as we said before, it is of three-fold benefit.

Hoyt Babbitt Metals give Maximum Service in the Work for which they are intended

Three HOYT METAL babbitts — "Frost King," "Trojan" and "Nickel Genuine" — ranging from a metal which keeps wheels turning in the coldest weather known, to a hard babbitt which stands up under the extreme heat of foundries and glass works.

Compounded scientifically to be exactly suited to their purpose. Give consistent satisfaction because they are mixed with scrupulous accuracy and care.

When you have trouble with bearing metals, let us show you the remedy.

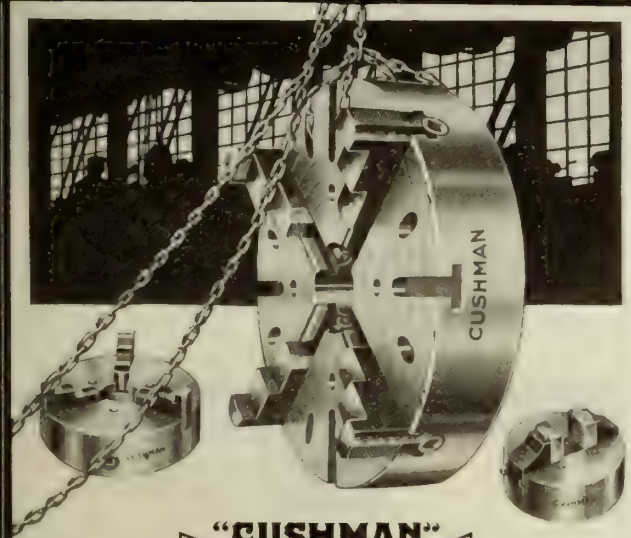
Chucks that have won their place



Jacobs Chucks have come to be as much of a necessity in modern industry as the drills they hold so firmly.

They have won their place by their durability, their firm grip, their freedom from drill breakage, and the ease with which they permit the changing of drills.

If you would know the value of Jacobs Chucks, ask any mechanic who has used them.

HEAVY MACHINE TOOLS

for

Shipyards, Boilermakers, Engineers and Structural Iron Works

(New and Second-Hand)

Lists on Application. Enquiries and Correspondence Solicited.

NEW AIR-TIGHT BLAST GATE

For Low and Moderate Pressures

"These have given entire satisfaction."

CANADIAN PACIFIC RAILWAY COMPANY

Montreal, Canada

For low and moderate pressures our New Air-Tight Blast Gate easily supersedes the heavy, cumbersome, expensive and slow-acting gate valves and stop cocks.

Costs only a fraction of what you pay for gate valves and stop cocks and saves time and labor.

Write for Circular 123-T. It tells how our blast gate is made, how it works and what users think about it.

W. S. ROCKWELL COMPANY

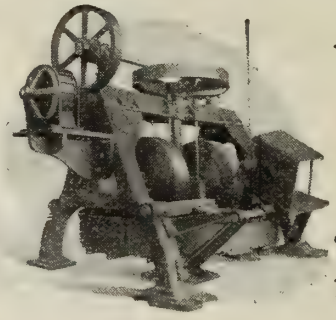
Furnace Engineers and Contractors

50 Church St., New York

Canadian Distributors: Drummond, McCall & Co., Ltd., Montreal.

RAE TOOLS

18" Quick Change Double Back Geared LATHE
20" Semi-Quick Change Double Back Geared GAP LATHE
RAE Crank Shaper



Tools of exceptional quality and accuracy for general machine work, with a reputation for long, efficient service.

Full specifications of any machine on request

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

That Vital Difference

The maker of a universally famous product once said:

"The difference between Failure and Success is doing a thing nearly right and doing it exactly right."

It's just this difference which makes ALL the difference in the performance of **"Barnes-Made"** Springs. Yet here's the vital difference that increases the reliability—and salability—of the machine in which these skilfully-made Springs are used—it's because **"Barnes-Made"** Springs are exactly right!

Just Specify—We'll Supply

Dept. C.M.

ESTABLISHED 1857

THE WALLACE BARNES COMPANY.

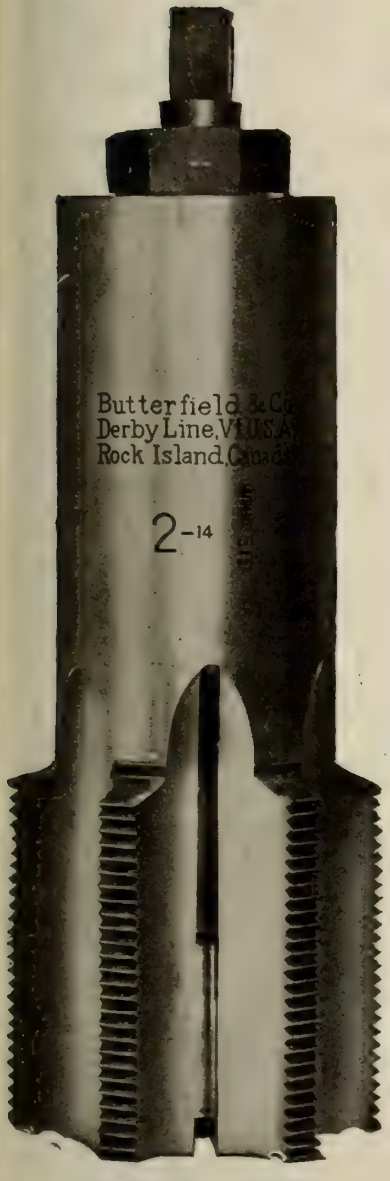
Tools That Retain Their Keen Edges After Long Usage

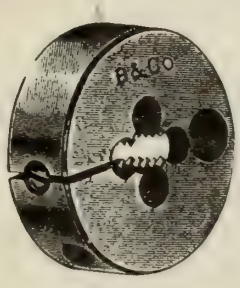
The condition of Tap, Die and Reamer after long usage proves the stuff they're made of and determines their real value.

Try Butterfield and you'll say they're the cheapest in the long run.

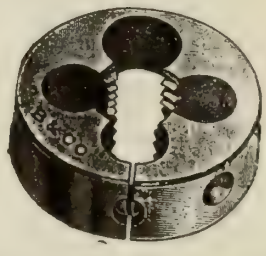


Butterfield

Taps, Dies, Reamers and Milling Cutters



Butterfield Tools assure the utmost in accuracy and they take heavy cuts with an ease and speed that make the best material look soft.



Let us make you acquainted with them now by sending a trial order.

Wide Range, Few Dies, Small Expense

The No. 1 Hartness die will thread from 3-32 inch to 9/16 inch diameter, all pitches.

The entire range from ¼ inch to 2¾ inch for standard threads, and to 3 inches for 8 pitch or finer, is covered by three sizes of dies, whose ranges overlap.

And any of these dies, even the large No. 9, will thread pitches as fine as 32 per inch on its largest diameter without danger of stripping.

JONES & LAMSON MACHINE COMPANY

MILWAUKEE SHAPERS

A PRODUCT of specialists in machine tool design. Distinctive in its simplicity and ruggedness, absence of unnecessary moving parts and ease of control—features which result in rapid, economical operation.

The quality of workmanship on this machine is on the same high level as the refinement of its design—perfect to the last detail. Capable of meeting the most exacting duties of modern industry.

Milwaukee Shaper Co.

Milwaukee, Wis.

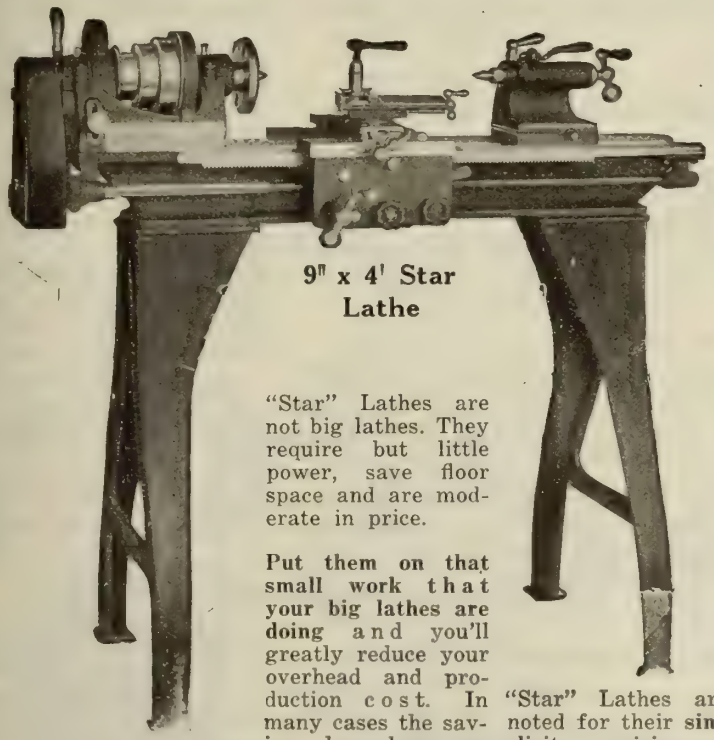
If this piece resembles something you are making, a Smalley-General Thread Miller will save you money

MATERIAL—Steel Forging.
LATHE TIME 35 minutes approx.
THREAD MILLER TIME—2½ minutes, floor to floor.
Note—If desird to face end true with thread add 45 seconds.

In any case, you are almost certain to be making internal threads, fine pitch, standard or Acme—somewhere in your shop—and you're probably doing it on a lathe.



That's why we're publishing these figures. Startling, aren't they? Just multiply the present production of your lathe by 14 and you get an idea of what is possible with the **Smalley-General Thread Miller** on jobs like this.

Speed is one thing, but accuracy and finish are usually important factors. **The Smalley-General Thread Miller** with ordinary labor produces work with a quality and accuracy superior to that turned out by a skilled man on a lathe.

Let us give you a guaranteed production estimate on your work.

Smalley-General Co. Inc., Bay City, Mich.

Montreal and Toronto : RUDEL-BELNAP CO., LTD.

9" x 4' Star Lathe

"STAR" LATHES

Suitable for all kinds of fine, accurate work from experimental to tool room and including production work.

"Star" Lathes are not big lathes. They require but little power, save floor space and are moderate in price.

Put them on that small work that your big lathes are doing and you'll greatly reduce your overhead and production cost. In many cases the saving has been as much as 40 per cent.

"Star" Lathes are noted for their **simplicity, precision** and **durability.** May we send catalogue?

11" x 5' Style "H" Star Lathe

A LANDIS FEATURE

Landis Engineers are always adding that "little bit better" factor to Landis Boring Machines.

For facing surfaces beyond the capacity of standard facing tools, special facing heads are made. They are designed to be clamped to the spindle, but on special order can be supplied with flange for attaching to face plate for special work.

Write for our new bulletin on *Boring* Machines.

20-inch Swiveling Facing Head

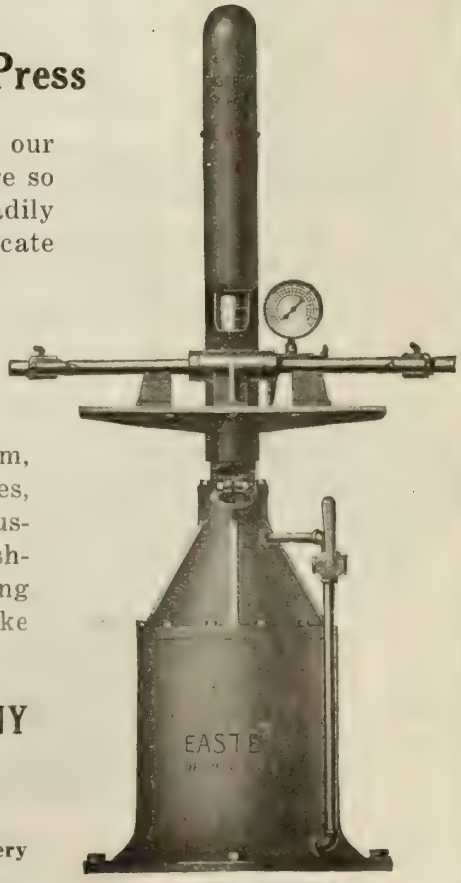
15 TON PRESS

A Simpler Hydro-Pneumatic Press

Complications in the construction of our High Speed Hydro-Pneumatic Press are so few that its operation is more readily understood than that of a more intricate machine.

Straightening, Forcing, Broaching



Particularly adapted for straightening cam, crank, pinion and wheel shafts, axle tubes, pinion tubes, assembling differential housings, assembling bearings in hubs, bushings in spindles and wheel rims, testing springs front and rear, broaching brake levers.

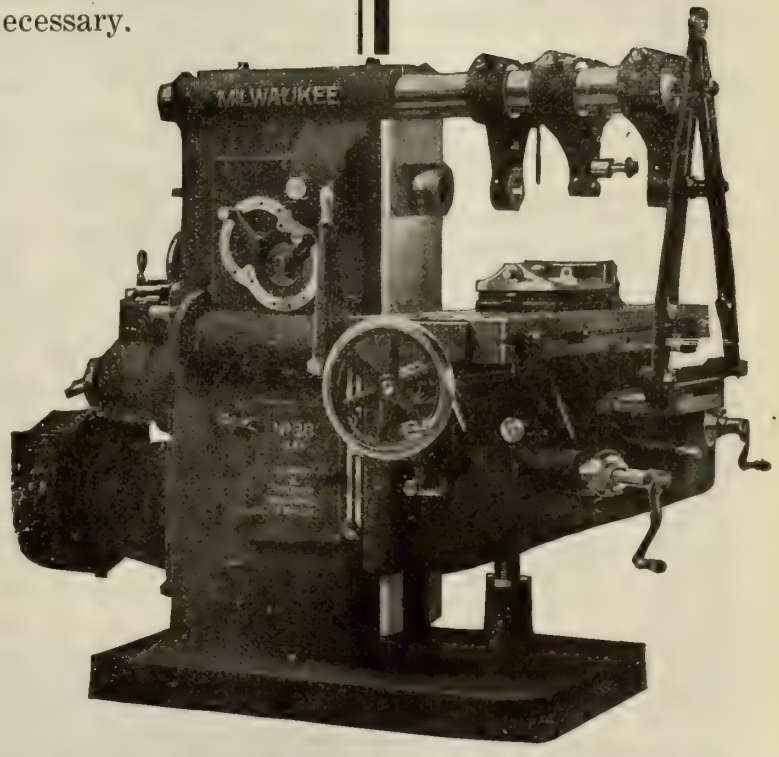
Milwaukee Milling Machines

Increase Production on a Low Upkeep

BECAUSE of the numerous meritorious features that Milwaukee Milling Machines embody, increased production on a low upkeep is obtained. They accomplish most accurate results and are easily operated, due to the convenient location of all levers and handles.



The column is a one-piece, box section casting with few and small openings, reinforced with heavy vertical and horizontal internal walls. The base is made pan-shaped to catch splashing oil and chips.

The double overarm provides for positive alignment of the arbor and prevents it from being pounded out of line when using large, coarse pitch cutters on rough, heavy work. This makes it possible to use cutters at a greater distance from the face of the column.

The spindle has a large flange forged on the end. This flange carries keys for driving large face milling cutters, that are attached directly to the flanged end by means of four bolts, and also for driving the hardened steel arbor drive collar. The arbor drive collar protects the end of the spindle from injury, so that when face milling cutters are attached they run true. The reverse for the spindle is self-contained within the machine, no overhead apparatus is necessary.

All gears and bearings in the column, feed box and pulley bracket are automatically flooded with lubricant that is pumped to the top of the machine and distributed by a perforated pipe. This pump operates whenever the drive pulley rotates.

Every Milwaukee Milling Machine is equipped with a cutter lubricating system which is an integral part of the machine and is not added as a separate item. The cutter lubricating system operates only when the spindle is running.

Complete facts, regarding Milwaukee Milling Machines, will be found in our catalogue. Write for a copy, TO-DAY.

BELTING

SCANDINAVIA BELTING is a general purpose belt for the machine shop, and it will pay you to use it for the following reasons:

It will not come apart, as there are no plies—it is solid woven.

It will give good service in hot places and is not affected by foundry gases.

It works well on belt shifters.

Its tensile strength is so great that it has been found to make the strongest harness trace known.

Get our prices to-day. Every day that you are letting go by without using some of this belting in your plant means money lost.

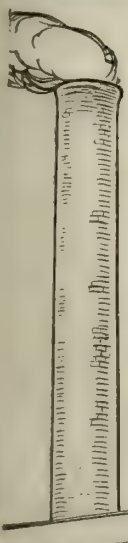
60 Rivets in a Minute

Faster if the work can be fed faster.
But at least 60 every minute.
And in tightest corners just as fast. Every head just as smooth. Not a bent shank; not a tool mark on either rivet head or casting.

GRANT



Rivet Spinning Machines

handle and rivet up to ¼-in. shank.
If Grant-made, every hard steel rivet is finished as smooth and as true as every rivet of soft brass.
The Grant Book called "Perfect Riveting" tells how to give an extra appearance of quality to your product. For your copy
Write to-day.

GRANT MFG. & MACHINE COMPANY
Holland Avenue, Bridgeport, Conn.

SMOOTH-ON IRON CEMENTS

A Power Plant Necessity

With labor scarce and new equipment so hard to get

SMOOTH-ON IRON CEMENTS

are even more vitally necessary than ever before. They make it possible to repair boilers, engines, and other equipment that would otherwise be discarded. Your supply house sells them.

SMOOTH-ON MFG. CO.

THE MASTER METAL

STELLITE

Not Steel—but its master

"Stellite" is a mixture of alloys that is harder, tougher and more durable than the best high speed steel ever made; so strong that it stands a heavier cut and so hard that it lasts longer between grindings.

"Stellite" has the extraordinary property of being immune to heat. Up to 1800° F., the hotter Stellite gets, the tougher it becomes and the better it cuts.

"Stellite" will show a tremendous increase in speed and economy in production. We will send a demonstrator on request.

PROOF
of the Dependability of the HENDEY Lathe

When you install a HENDEY Lathe you are certain of satisfactory results. Testimony coming out of shops where the HENDEY is in use proves this.

"NONE BETTER FOR ACCURATE PRODUCTION WORK" is the testimony supplied by the Jones Machine Works, of Philadelphia, a portion of whose shop is herewith illustrated, showing HENDEY Lathes in action.

These machines are finishing cast-iron eccentrics. The operations consist of two roughing cuts, one finishing cut, and turning the outside diameter.

When you wish to purchase Lathe remember what present users say of HENDEY Quality.

THE HENDEY MACHINE COMPANY
Torrington, Conn., U.S.A.

GRAY 22" x 22" SPUR-GEARED PLANER

Gray Planers are built by a firm that makes nothing but planers. They are given the entire time and attention of a large organization—and their performance shows it.

In designing this tool the parts have been so proportioned and the metal so distributed that the planer is quick acting and simple in operation, and yet sufficiently stiff, stronger and powerful to perform a great portion of the work for which larger, heavier and more clumsy planers are ordinarily used. May we send you full details?

THE GREAT VARIETY
AND
EXCELLENT QUALITY
of Canadian-made machinery

makes it inadvisable for Canadian buyers to go out of Canada for their machinery requirements—especially so in face of the extremely high discount placed upon the Canadian dollar in New York Exchange.
We are prepared to furnish complete detailed information and specifications of our various machines and invite your inspection.

"BB" DROP HAMMERS

1000 lb. BOARD LIFT HAMMER

Our latest type of hammers have exclusive features that add greatly to the life of the hammer as well as increasing the production.

The old-fashioned, noisy gears have been eliminated entirely, the hammer being lifted by friction exerted by a powerful eccentric motion under perfect control of the operator at all times.

The BROWN-BOGGS CO., Limited

Manufacturers of Sheet Metal Working Machinery, Presses, Shears, Rolls, etc.

You Need a Good Die Stock Set

if you need one at all.

Because a **GOOD** Die Stock Set embodies:

1. Accuracy in its product.
2. Adjustment for wear.
3. Free cutting qualities.
4. Provision for sharpening.
5. Ample adjustment for oversize or undersize.

P. & W. Die Stock Dies **ARE GOOD DIES.**

BETTER than most because of the interchangeable feature in their chasers. A broken chaser in a P. & W. Die doesn't mean a new set of chasers. You can get a new chaser to replace a breakage and the new one "fits" in perfectly in your old set. That's the 6th point **"ECONOMY IN OPERATION."**

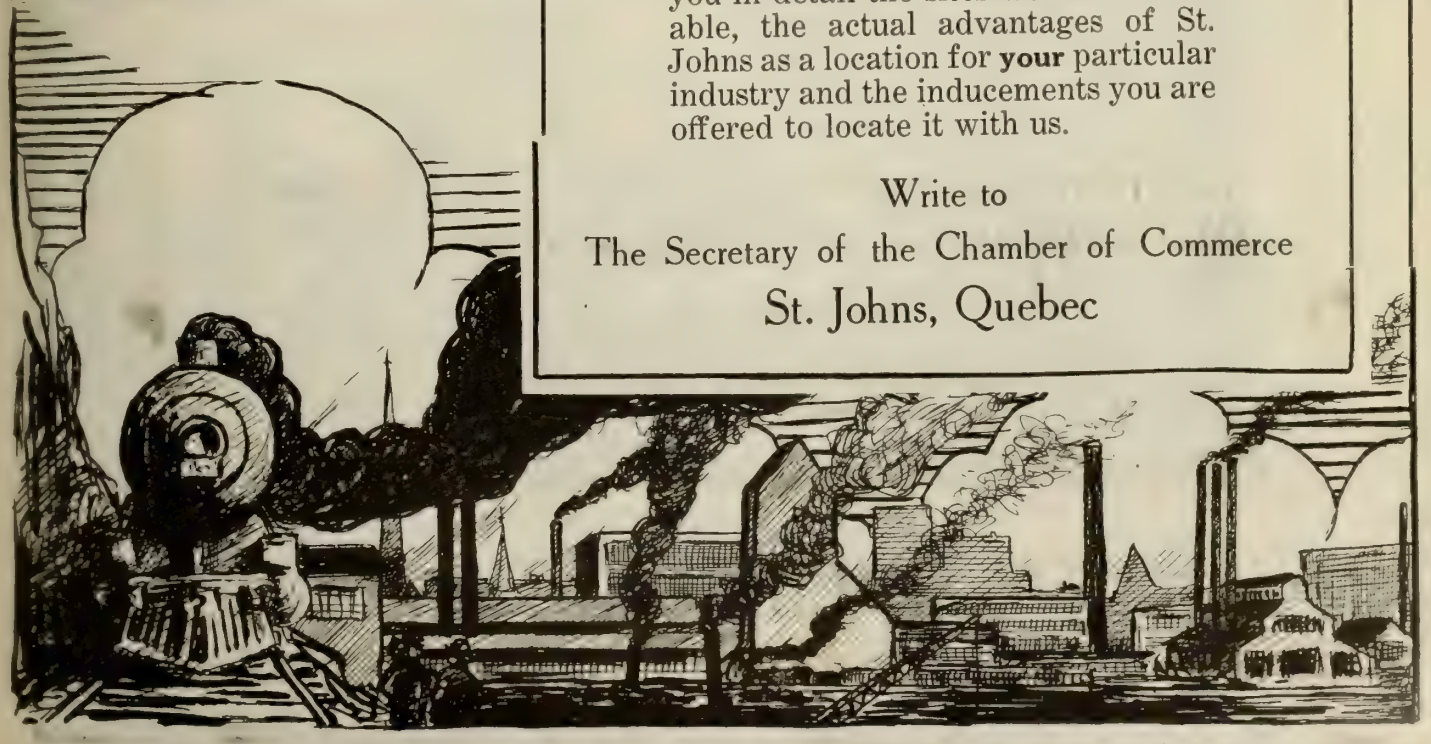
ST. JOHNS, QUEBEC

Seven railroads to all Canadian Eastern U.S. points.
27 miles from port of Montreal.
On the Richelieu River, a link in the system of waterways and canals connecting New York and the Eastern seaboard with the Great Lakes.
Cheaper freight rates and fuel than any other centrally located industrial city in North America.
Ample electric power at low rates.
Cheapest labor market in Canada.
Skilled and unskilled labor plentiful.
Living conditions excellent.
Low cost of living—no labor troubles.
Sites available with all public utilities.
Unparalleled inducements to new industries.



That new factory —where will you locate it?

You can't decide intelligently until you know the relative advantages of the locations you are considering.

You risk an expensive mistake if you do not compare with the others the city of St. Johns, Quebec.

The full advantage of this city as an industrial site can not be discussed briefly. You will do well to get into direct touch with us and let us show you in detail the sites we have available, the actual advantages of St. Johns as a location for **your** particular industry and the inducements you are offered to locate it with us.

Building Pumps
With the aid of Air Tools

The part played by pneumatic tools in the manufacture of modern pumping equipment is an important one. From the ramming of molds, grinding and chipping of castings in the foundry to the machining and final assembly of parts they are almost indispensable to economical and rapid production.

Perhaps you do not make pumps, but, if your product is made of metal, it will pay you to investigate the merits of "Little David" Air Tools as a means of speeding up your output and lowering your overhead expenses.

Our nearest branch will be glad to help you with your problems. Ask them for a copy of Bulletin 8000 describing the "Little David" line.

Little David AIR TOOLS

The Cleaning of Metal Parts in Process of Manufacture—

The Problem—

In a certain plant, small brass parts were washed with soda ash to remove rubber compound. Soda ash left a sediment, so five girls were employed to scrub the parts with soap to remove the sediment. This operation was slow, tedious, costly.

The Solution—

An Oakite representative was consulted. The use of 30 pounds Oakite weekly to replace 444 pounds soda ash was recommended. Oakite was adopted, The parts now come from the tank absolutely clean. No sediment. No scrubbing.

The Result—

Oakite has saved this plant $83.52 weekly on one cleaning operation.

This Advertisement is one of a series based on actual occurrences.

A lar. e Automobile plant now uses Oakite and saves $67 on each car produced—with an output of several thousand cars a week.

And a small concern making metal parts for computing scales saves $11.25 monthly by using Oakite—one-half former cleaning cost.

Between these extremes there are countless recorded instances where Oakite has saved time, money, labor

May We Serve YOU Too?

The Ford-Smith Machine Company

FORD-SMITH MILLING MACHINES

No. 3 Full Universal Miller

The Ford-Smith Miller is a high-grade machine embodying the best practice in machine tool design and construction.

The workmanship is of the highest grade and is rigidly checked for both accuracy and finish by an elaborate inspection system.

The Dividing Head and the other attachments for this machine are of the same superior quality.

FORD-SMITH MILLERS have distinguished themselves for power, speed and unfailing accuracy.

The latest Ford-Smith Catalogue will be sent on request.

BRIGGS

MILLER

Keeps Five Die Sinkers Going

HERE you see the Briggs Miller Squaring Die Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

"Impossible With Any Other Style of Head Than the Landis"

A. Harvey's Sons Manufacturing Co., Ltd.

ESTABLISHED 1855

STEAM, GAS, PLUMBING GOODS,

PIPE, BOILER TUBES, FITTINGS, TOOLS AND MILL SUPPLIES

PIPE BENT, FORMED AND CUT TO SKETCH

BRASS AND IRON FOUNDERS AND MACHINISTS

DETROIT, MICHIGAN, March 27th, 1917.

Landis Machine Co.,
Waynesboro, Pa.

Gentlemen:-

It might interest you to know that after the installation of the 4" to 8" Landis Pipe Die Head on our 8" machine that this machine was in daily use for a period of ten hours each day and for the first fourteen months of service none of the chasers had to be removed from the head for even so much as sharpening. These chasers were of high speed steel and were used on cutting both steel and wrought iron pipe.

This performance in our opinion would be very difficult to equal and impossible with any other style of head than the Landis.

You are at liberty to use this letter as you see fit, either with or without our name, as it is a pleasure to us to recommend tools that have given us service that the Landis tools have been giving.

Yours very truly,

A. HARVEY'S SONS MANUFACTURING CO.

C. F. Harvey, Vice-Pres.

THIS is Mr. Harvey's experience with the Landis Die. This head was not an experiment with this Company for six Landis Machines and five Landis heads preceded this one, the performance of which, brought forth this letter.

A. Harvey's Sons' work is varied, it requires accuracy and a high production which is insured by the Landis die. The photograph shows one of the latest type 8" Landis Stationary Pipe Die Heads cutting 8" pipe, eight threads to the inch.

Keep the distinctive features of the Landis Die in mind—longer life, higher production, absence of annealing, hobbing and retempering, variable rake angle, permanent throat, etc.

The Landis Die will handle your threading requirements just as effectively as it has others.

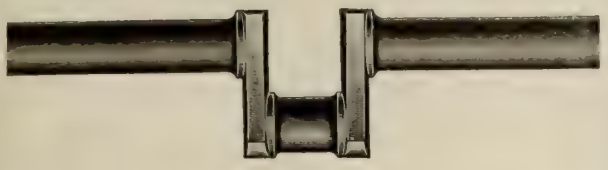
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines

TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.

Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and **do twice the work.**



You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

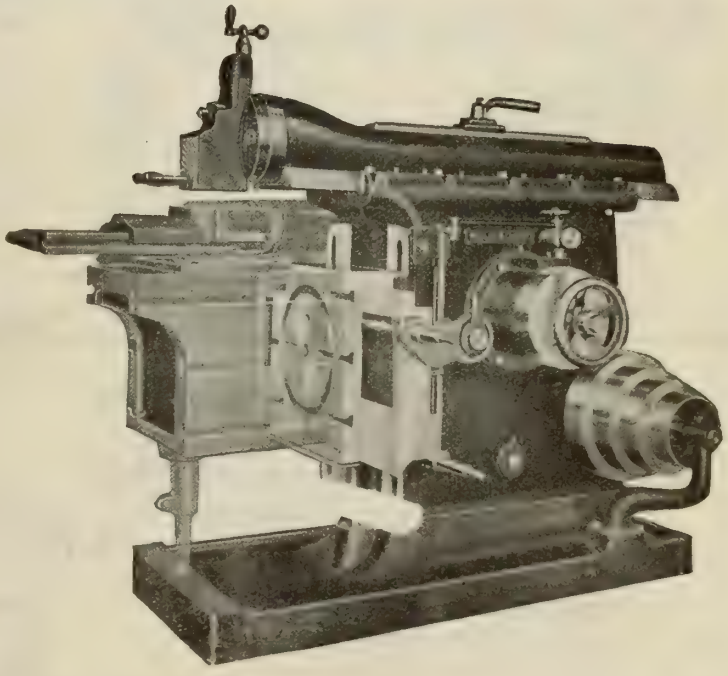
You may not buy your machine tools on a beauty basis

But you're pretty certain to be suspicious of a machine which is ugly to the mechanic's eye.

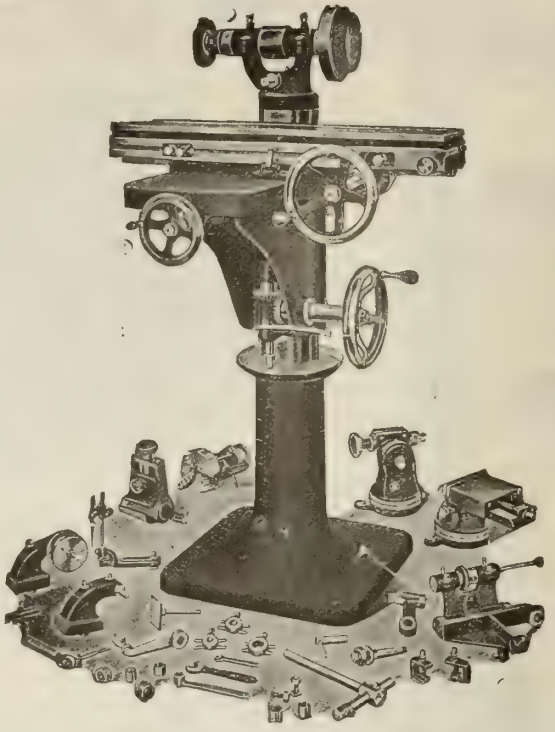


"When a machine is wholly right it is pretty sure to look right."—Professor Sweet.

The trained eye of the mechanic or the engineer rarely fails in its judgment. Heavy parts look awkward; light parts look weak; incorrect proportions look ugly; unnecessary parts look cheap.

"To be good, a design must be consistent."—Professor Sweet.

Designed by specialists in machine tool design, the Milwaukee Shaper is proportioned to be wholly right for its work. The machine is a beauty and we are proud of it. It's an indication of the quality of the design.



Literature describing this machine in detail, and any other information we can supply, is yours on request.

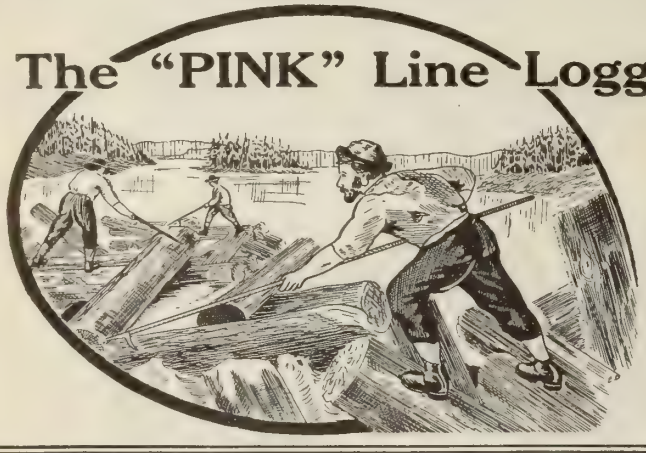
Greenfield

May we send you a complete description?



UNIVERSAL AND TOOL GRINDER

The Greenfield is equipped with all attachments for the grinding of milling cutters, reamers, taps, lathe centres, etc., and capable of handling all this work with the accuracy and convenience essential in the modern tool room.

The Greenfield is a simple necessity in the tool room for routine grinding work, but has a versatility outside this line that is astonishing. It is truly universal and handles all varieties of cylindrical, internal and surface grinding within its capacity with a consistent accuracy and finish that adapts it to the making of intricate jigs and goges.

Greenfield Machine Co.

MULTI-DRILLERS NATCO MULTI-TAPPERS

The "Hole" Story in One Word

Don't Try to Cut too Fast

Hack Saws, like men, can work only about so fast and be efficient.

Trying to cut the cost per cut by simply running the saw faster almost invariably results in just the opposite. Excess speed with a hack saw heats the blade and draws the temper. The likelihood of the teeth dragging on the return stroke is increased and if the teeth strike a soft spot in the work, and "dig in," they're almost sure to strip.

To cut down the cost of your hack saw work, select a good make of saw — most machinists prefer Starrett blades. Be sure that you are using the right blade for the particular work you have to do. Regulate your weight properly, flood the work with lubricant, and most of your troubles will vanish.

The Starrett Hack Saw Chart saves a lot of time and trouble wherever it's used. If you haven't a copy, your dealer will supply you or a copy will be mailed on request.

Ask for Catalog No. 21 "3" also.

FRED HERBERT, Foreign Agent, Coventry, England

Distinctive Features that Build Speed Into Whitcomb-Blaisdell Planers

The Patented Self-Locking Shipper Dogs

Provide Quick and Easy, Yet Safe Adjustment of Table Travel

Finger pressure upon the small lever releases the shipper dog for shifting. When slid into the desired position, the releasing of the lever locks it instantly and automatically.

No wrenches are required for adjusting these shipper dogs. No time is wasted; only a moment is required for positioning the table travel just as required by the work.

The danger of the operator being caught between the table and the housing of planer, while changing the stroke, is entirely eliminated.

This is typical of the many provisions for rapid adjustments on the Whitcomb-Blaisdell Planer.

It is not alone the extremely high cutting speeds, permitted by the Patented Second-belt Drive, which makes the Whitcomb-Blaisdell Planer so productive. Hardly less important a factor is the completeness of its provisions for speed in adjusting and operating.

Write for our latest Catalog, which tells in detail all the reasons for Whitcomb-Blaisdell Planer Speed.

FRANKLIN
DIE-CASTINGS

They Solve Cost and Production Problems

The demand for increased production is due to the need for lower costs. Franklin Die-Castings can help meet both these requirements.

Canadian manufacturers can substitute Franklin Die-Castings for many parts they now machine, and turn their labor and equipment to more urgent needs. At the same time they will lower their production costs. Franklin Die-Castings are cheaper than machined parts because they are accurately and uniformly finished in one operation—thereby saving both the time and material lost in machining.

Twenty-eight years ago Franklin engineers originated the die-casting industry. Through their advice on the use of die-castings, much machinery has been cheapened, simplified, or made commercially possible.

We cast in Aluminum, Tin, Lead, and Zinc base alloys, and make estimates from samples, drawings, or blue-prints. Send for booklet.

FRANKLIN DIE-CASTING CORPORATION

GIFFORD AND MAGNOLIA STREETS, SYRACUSE, N.Y.

Speed Up Your Metal Cutting

Drive your sawing machines to the limit. They'll stand it if you fit them with

Hunter "Duplex" Blades

The design of this inserted tooth saw gives the greatest possible number of teeth, with the result that material can be cut with greater speed, as the rigid construction withstands heavier feeds.

For fast cutting and long life specify Hunter "Duplex."

Hot Saws, Friction Discs, Solid Blades made from Vanadium, Tungsten and Chrome Alloy Steels. Saw Sharpening Machines, Inserted Tooth Grinders. Hardened Steel Specialties, etc. Write for prices.

Hunter Saw & Machine Co., Pittsburgh, Pa.

THE MASTER METAL ▣ THE MASTER METAL

STELLITE

Not a steel—but its master

Here's the point—

Stellite is a cutting tool that is immune to heat. Stellite cuts coninuously at temperatures up to 1800 deg. F. Stellite operates just as well or better when it is red hot.

Stellite will not burn or crumble under high speeds or heavy cuts. Stellite production is limited only by the capacity of the modern lathe. Stellite tools permit speeds never before known in lathe tool history. The introduction of Stellite into a shop means a soaring leap in quantity and quality of work — accompanied by a tremendous increase in economy.

Stellite is the vital factor in modern shop methods. You should know all about it. We will send a demonstrator on request.

Sift Sand by Electric Power and cut down your pay roll

THE "PRESTON" Ball Bearing Electric SAND RIDDLE

WILL save in wages $1.00 every hour the sifter runs—at the most conservative estimate.

WILL riddle sand as fast as a man can shovel it in and costs only one cent per hour for current used.

"If you need it you pay for it whether you buy it or not"

OUR OFFER:
Sand Riddle sold subject to 10 days' trial; and acceptance of same left entirely to the judgment of the purchaser.

Buy Made in Canada Goods and Make Sure that your good Canadian Dollar Buys 100 Cents worth.

PRESTON WOODWORKING MACHINERY CO., LIMITED, PRESTON, ONT.

The LYMAN LINE

of Industrial Equipment includes

"Cyclone" High Speed Chain Hoists

"Cyclone" Hoists get their leverage and power without the use of any small gears or pinions—by a method quite different from that used in any other chain hoist. "Cyclone" construction lessens friction, vibration and wear, increases strength and produces a smoother, easier running hoist that will outlast any other.

The trim compactness of this 40-ton model is typical of the whole range of sizes, from ½ ton up.

The inside of the "Cyclone" High Speed Chain Hoist is one of the most ingenious and effective pieces of mechanism in general use. If you are not familiar with it one of our representatives will be glad to show a complete model, or we'll send you our new catalogue describing the construction.

Forging Ahead for 30 Years

Three decades of constant effort and careful development have placed Sturtevant Direct Current Motors in the foreground of electrical apparatus built in this country.

The motor you purchase should embody efficient design, selected materials, and skilled workmanship to assure you of a unit which will stand up under most exacting operation.

Sturtevant
(TRADE MARK)

TYPE "D" GENERAL-PURPOSE HEAVY-DUTY DIRECT CURRENT MOTORS

WITH GUARANTEED OVERLOAD CAPACITY

are designed and built to give you enduring, reliable service and power economy. They are readily adaptable to constant or variable speeds and to all requirements demanding a commutating pole type unit. The bearings are liberally designed and do not leak oil. All parts requiring attention are very accessible. Consult any one of our 24 engineering offices or ask us to send Bulletin 217H.

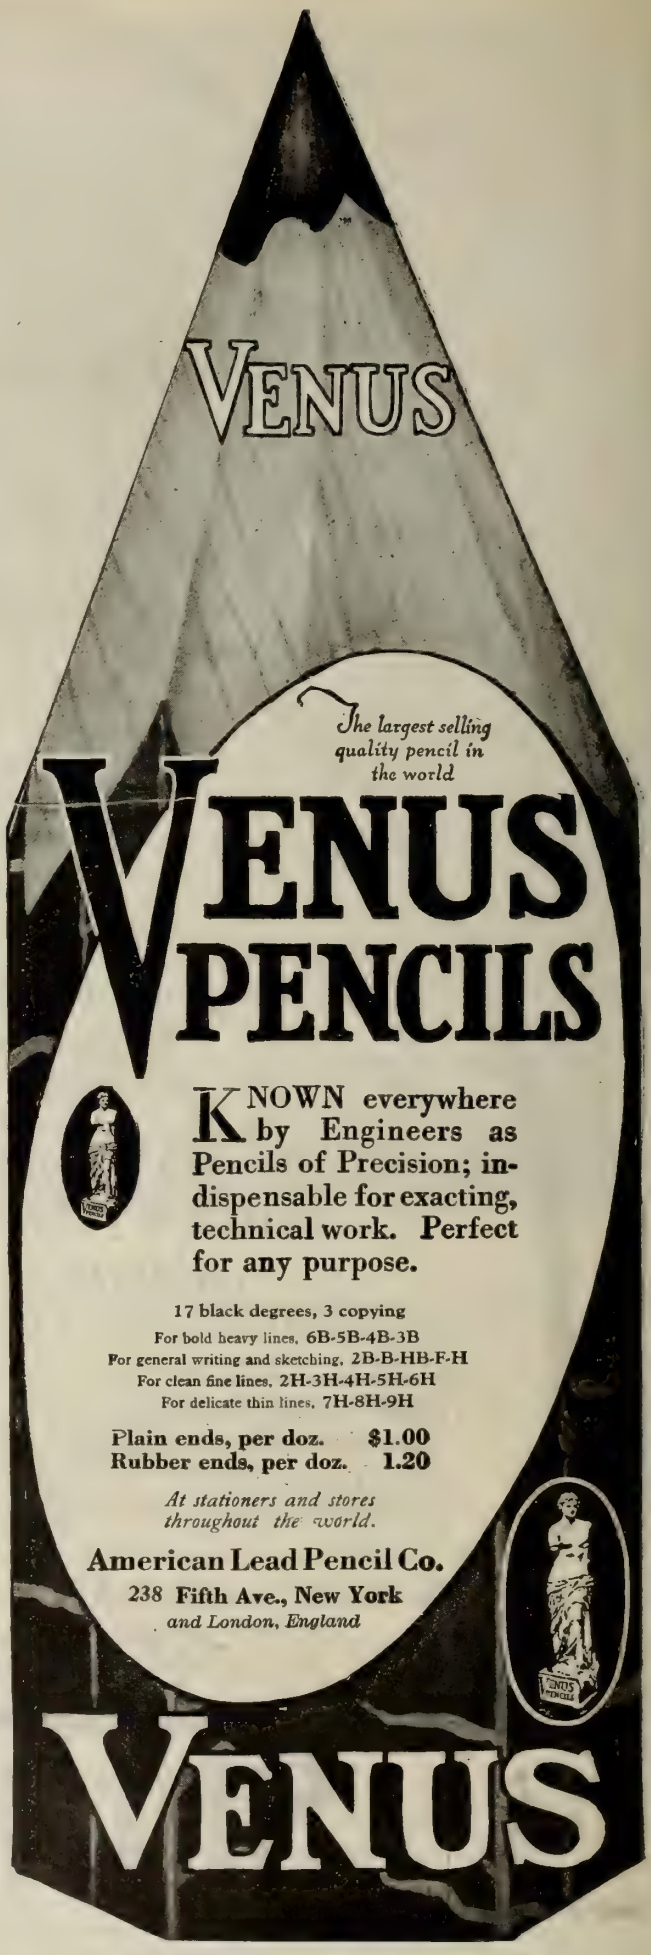
Inferior Files Mean Waste Money

If your files fall short of perfect efficiency and reasonable length of service, you are throwing away money.

Famous Five Files do a job as perfectly as it can be done and do not dull quickly.

The steel in them is made from a special formula, the teeth are properly cut and they are thoroughly hardened.



They get the best results with little effort. They last.

The Famous Five are:

RED-CUT SUPERIOR HIGH SPEED STEEL

VANADIUM ALLOYS STEEL CO LATROBE, PA

A GREAT MAN wrote this: "I'm called away by particular business, but I leave my character behind me." And nobody had to guess whose character it was. Even if the familiar Red Cut label should disappear there would be no doubt as to the character of the steel that remained. More than ever would the quality shine forth in the results when it was worked. Adherence to the highest standard with an unvarying uniformity has placed a well merited reputation all its own on

GOODYEAR
MADE IN CANADA

EXTRA POWER BELTING

Pulling the Peak Load

Nearly every industry has some belt-drives with variable loads.

Nearly every industry has had belt trouble when the peak came on these drives.

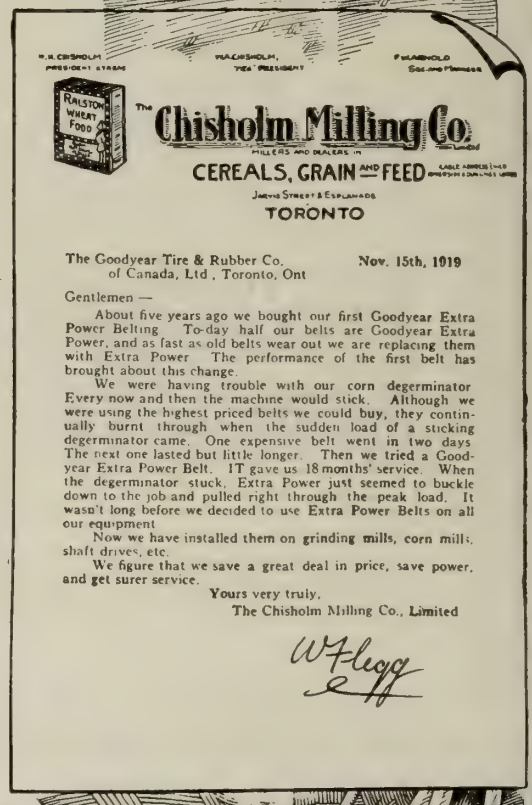
One of the best things Goodyear Extra Power Belting does is to take care of peak loads without trouble.

How it has solved one peak load problem is told in a letter to us from the Chisholm Milling Company (reprinted here).

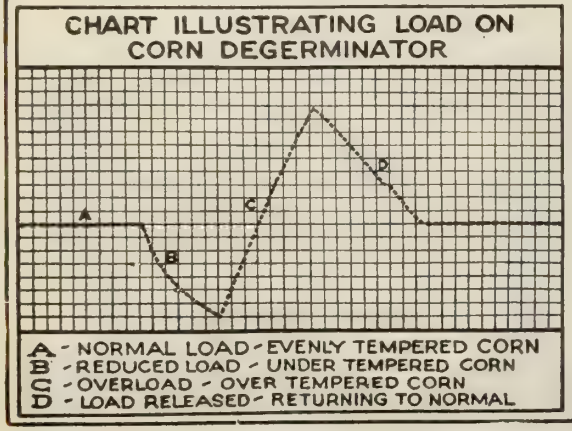
The very qualities which give Goodyear Extra Power its great advantage where loads vary, make it a better belt for all-round use.

The *pulley-gripping friction surface* pulls over the stiff places and prevents power waste through slippage.

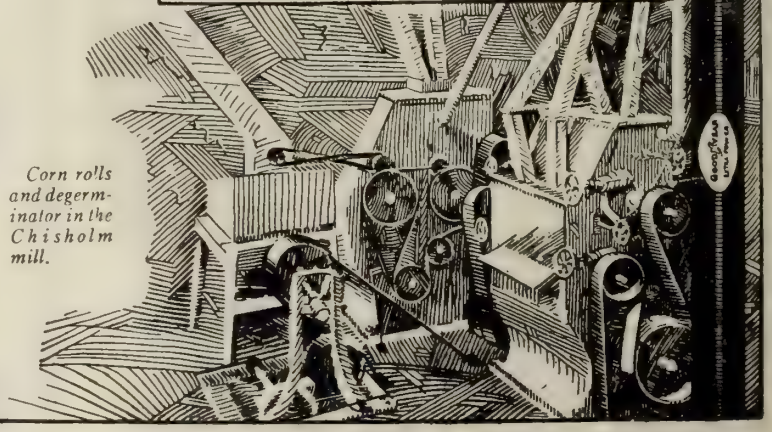
The *great strength of the fabric plies* which are welded into one by much fine rubber, gives very long life.



Practically *all the stretch is taken out* of Goodyear Extra Power before you buy it—saving costly shut-downs to tighten belts.



The fine rubber, *which seals the seam*, prevents ply separation.



Over 1000 Canadian industrials have found Extra Power Belting an economical proposition—in price, in length of service, in efficiency of service. Some of them have solved problems exactly similar to yours. Let a Goodyear-trained belting man tell you about it. No obligation. Just phone, wire or write the nearest branch.

BRISTOOL

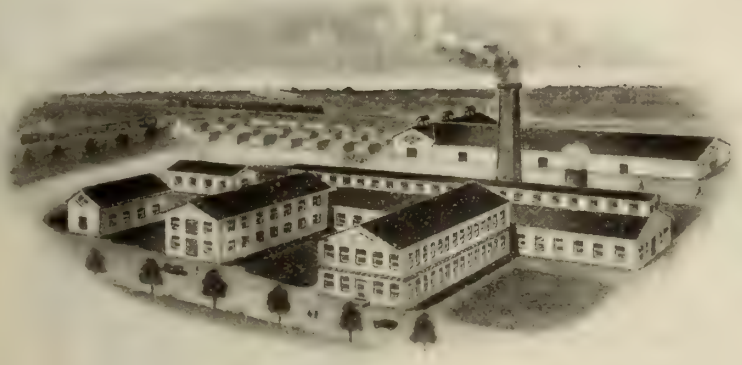
Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.



Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Grinds within .0004 in. of absolute Accuracy

2 Minutes or 20?

This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

Welding Fence Gate Frames with Armco Iron Welding Rods

ARMCO IRON

WELDING RODS

used for Welding Wire Link Gate Frames

We use Armco Iron Welding Rods in our own manufacturing departments for both oxy-acetylene and electric arc welding.

One of our quality products is a Wire Link Fabric used extensively for partitions and fences in and around industrial plants. This fabric is made of Armco Iron and only the best welding wire would be considered good enough for welding the gate frames. Armco Iron Welding Rods are therefore used exclusively for this purpose.

Armco Iron Welding Rods have a guaranteed minimum pure iron content of 99.84 per cent. and are unequalled in chemical and physical uniformity. They flow freely and make an even weld which lends itself perfectly to finishing operations.

Our nearest sales office will give you the addresses of Armco distributors in your locality. And if you happen to be interested in factory partitions or fencing we will be glad to inform you fully regarding Page Armco Iron Wire Link Fabric.

Thread milling the ordinary work means better threads—it also means *greater* economy

We're publishing a time study on the simple, everyday job because we want to show you that the Smalley-General Thread Miller is just as economical on simple as it is on the more intricate, complicated work. It's not a special machine for special jobs. It's a practical time and labor saving machine that will cut the cost of practically any threaded work—simple or difficult—that you have in your shop.

Send us blueprints of any of your threaded work and we'll work out guaranteed production speeds of the Smalley-General Thread Miller on it. If you send us a few samples we'll be able to show you the accuracy and quality that milling will put into your threads.

Smalley-General Co., Inc.
Bay City, Mich.
Montreal and Toronto: Rudel-Belnap Co., Ltd.

MATERIAL—Cast Iron.

LATHE TIME—Outside thread, 30 minutes, approx.; inside thread, 45 minutes approx. Not including chucking.

THREAD MILLER TIME—Outside thread, 4 minutes; inside thread, 5 minutes. Floor to floor.

Note—Milled from rough. No turning or boring necessary on threaded surfaces.

Type B
Guaranteed to 80,000 lb. pressure

Speed Up Tool-Making

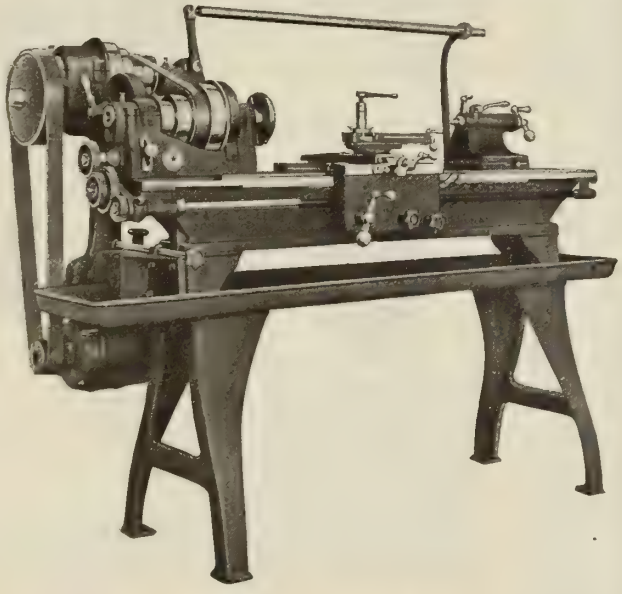
Silver Drills

Economy on High Class Work

When accuracy and finish are essential in the work, increased production can only be obtained from a **powerful** drill that has the rigidity necessary to retain its accuracy at high speeds.

All Silver Drills possess this vital feature—and you will not find another drill that is simpler to operate.

There are a number of models and sizes. The cut shows the 25-in. with 8 spindle speeds, 6 positive geared feeds, automatic stop, etc.



Our catalogue contains detailed information and data on all Silver tools. It is yours on request.

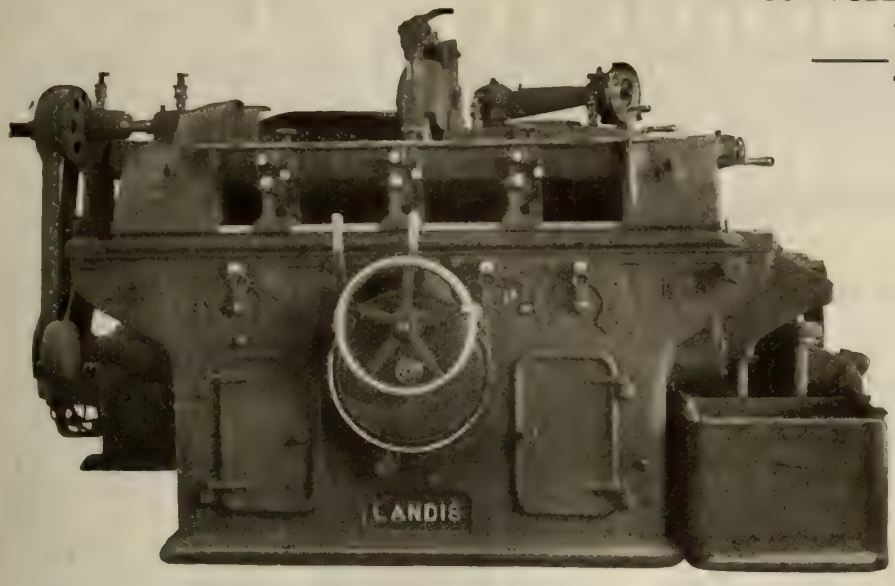
"STAR" Screw-Cutting Engine Lathe

11" Swing, 5 ft. Bed, WITH ELECTRIC MOTOR DRIVE
Showing Gear Guard Removed

The individual motor drive is a valuable attachment for any size of "Star" lathe—9 in., 11 in., or 13 in—in shop or tool room service.

The belts are of ample size to develop the full capacity of the lathe, and the resulting drive is flexible enough to prevent the damage both to lathe and motor which is a possibility with gear or chain connections. The belts may be quickly tightened without shortening.



Starting, stopping, and reverse rotation of lathe spindle controlled by shifting bar within easy reach of operator. Reverse speed faster than forward motion. Eight spindle speeds are immediately available with a four-step cone. Motor to suit any voltage, A.C. or D.C., supplied by us or by purchaser of attachment.
Full description of this attachment and complete catalogues of the "Star" line on request.

The Connecting Link between Power and Production

MAXIMUM production can only be attained through uninterrupted transmission of power from line-shafts to machines. Belts *will* break. Because no method to-day equals the "Clipper" for speedy repairs, "Clipper" belt hooks are the connecting links between power and production. "Clipper" hooks make possible practically continuous operation of machines during working hours in the workshops of the world.

The Clipper Belt Lacer
Laces a Belt in Three Minutes

Out-of-date methods take from ten minutes to half an hour. The "Clipper" makes a durable joint—one that is smooth on both sides, is as flexible as the belt itself, is safe and pulls right.

The "Clipper" goes to manufacturers on free trial and is perpetually guaranteed.

Clipper distribution is world-wide through mill-supply houses. Where we are yet open for representation our dealer proposition is one of mutual profit.

Conveyor Belts that Stay on the Job

Automobile Tire Treads encounter and must withstand the most abusive, abrasive service. Nothing but the very toughest and strongest rubber stock will stand it long.

"Efficiency" Conveyor Belts are heavily armoured with Tire Tread Rubber of great strength and elasticity. A single cord of this toughened rubber, one inch square, possesses sufficient strength to readily suspend in mid air a big load of hay and will stretch several times its original length without breaking.

"Efficiency" Conveyors, like highest grade Auto Tires, are made for the most exacting service.

Though of immense strength they trough perfectly, and, of their own weight, automatically conform to the idlers.

Other very important features in their construction we are unable to detail here, but they represent economy in operating cost for you. When in need of Conveyor Belting let us send a representative to demonstrate them.

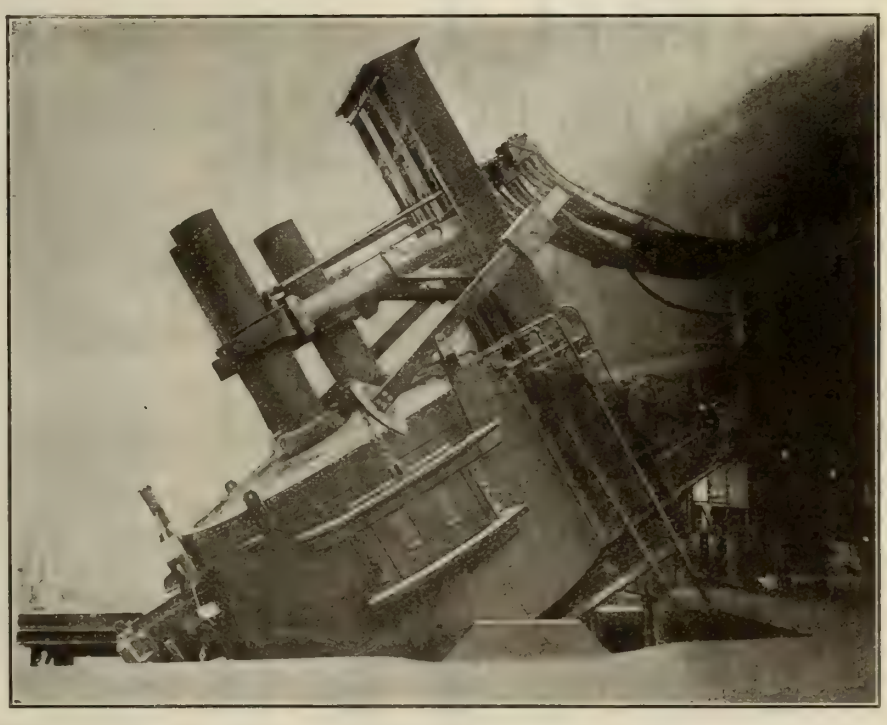
6-Ton VOLTA Furnace in Running Position



Besides the economy involved, the production of steel castings with the electric furnace means a particularly fine grained product, with a perfect control of its chemical composition.

VOLTA Electric Furnace

A consistent producer of high grade steel castings of superior physical properties.
For the most economical results an electric furnace must be designed with all the modern operating devices which help in eliminating delays between heats and excessive length of time in refining.

Volta Electric Furnaces are built in capacities from one to six tons and nothing is spared in their design and equipment to make them efficient. Our ten years of extensive experience in electric furnace work has made us competent to advise you on your steel casting proposition.

The accompanying illustrations show the Volta furnaces recently installed by us for the Dominion Foundries and Steel Co., Hamilton, where the two six-ton furnaces have replaced the open hearth furnace for the production of high-grade steel castings and alloy steels.

Have as many Trucks as you want

With the Holyoke System it won't cost much

Just build strong wooden platforms, pile your material on them, and one man and one "Holyoke" will put any part of that material on wheels in a few second, even if it weighs 2½ tons. Your material is always ready for the next machine, storage, inspection, or the warehouse—without handling the material or damaging it in any way.

And when you don't need so many trucks, just pile your platforms in a corner. They'll stack neatly, won't waste valuable floor space, won't represent a lot of capital tied up, and are ready for use immediately. The "Holyoke" system is the rational, sensible system. You can't beat it for flexibility and economy of time and labor. Besides all that, it's the cheapest system in first cost. Shall we send you our booklet "Inside Transportation?" It explains the superiority and economy of the "Holyoke."

WILLIAMS & WILSON, Montreal

REAL FIRE BRICK SERVICE

When you buy Elk Fire Brick we sell you a brand with the qualifications equal to the duty for which it is intended. We do not recommend the best quality brick for a certain job if a lower-priced brand will stand up just as well. Each brand of

ELK FIRE BRICK

has some particular qualification which fits it to give better results in certain places than other brands we produce.

OUR BRANDS:

"Elkco"
"Elkco" Special
"Elk Steel"
"St. Marys"
"Keystone"
"M.D. Elk"
"Rotex"
"Elk Ladle"
"Elk Dust"
"Keystone Dust"
"Rotex Dust"

Try us on your next fire brick needs. You'll find both our quality and service right.

Large stocks of various shapes carried in warehouse in Hamilton.

ELK FIRE BRICK CO. OF CANADA LIMITED
Sun Life Building, HAMILTON, ONTARIO

Hoyt Babbitts, particularly Frost King, represent maximum value at minimum prices, possessing all the qualities and overcoming all the usual Babbitt faults found in ordinary bearing metals. We've been making Babbitts for nearly half a century.

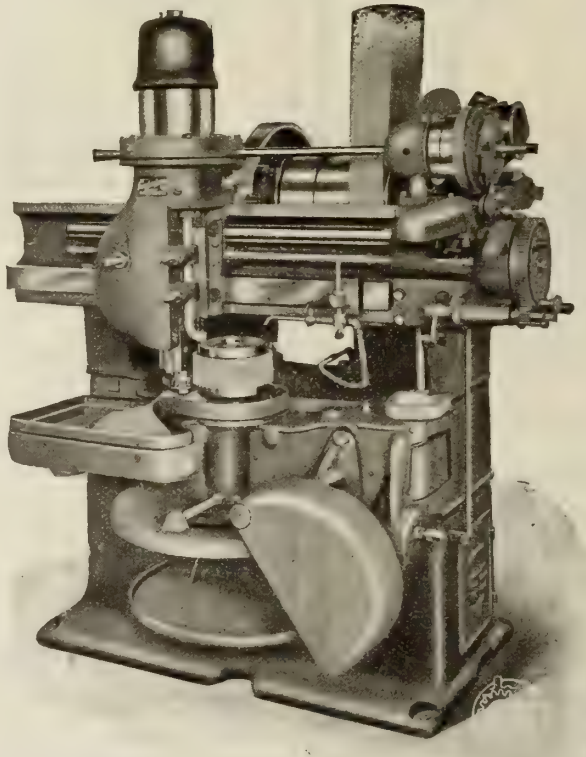
Gear Cutting With the "IFS" Left Out

The Gear Shaper Way

A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."



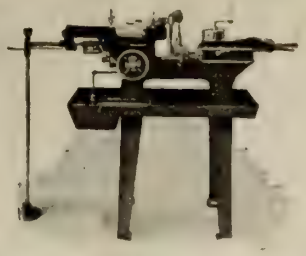
When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—

Gear Cutting with the "IFS" Left Out.

Send for your copy to-day.



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

DESIGN OF HEAD

SECOND OF A SERIES OF ADVERTISEMENTS

DESCRIBING THE FOSTER NEW LINE OF HAND SCREW MACHINES

Head

Since Fred W. Taylor made the initial discovery of high-speed steel, improvement of same has followed improvement in rapid succession. The cutting steels have been made to stand higher speeds and faster feeds.

This has forced machine tool builders to redesign their machines from time to time. Larger amount of power and more rigidity has been called for because of better cutting tools.

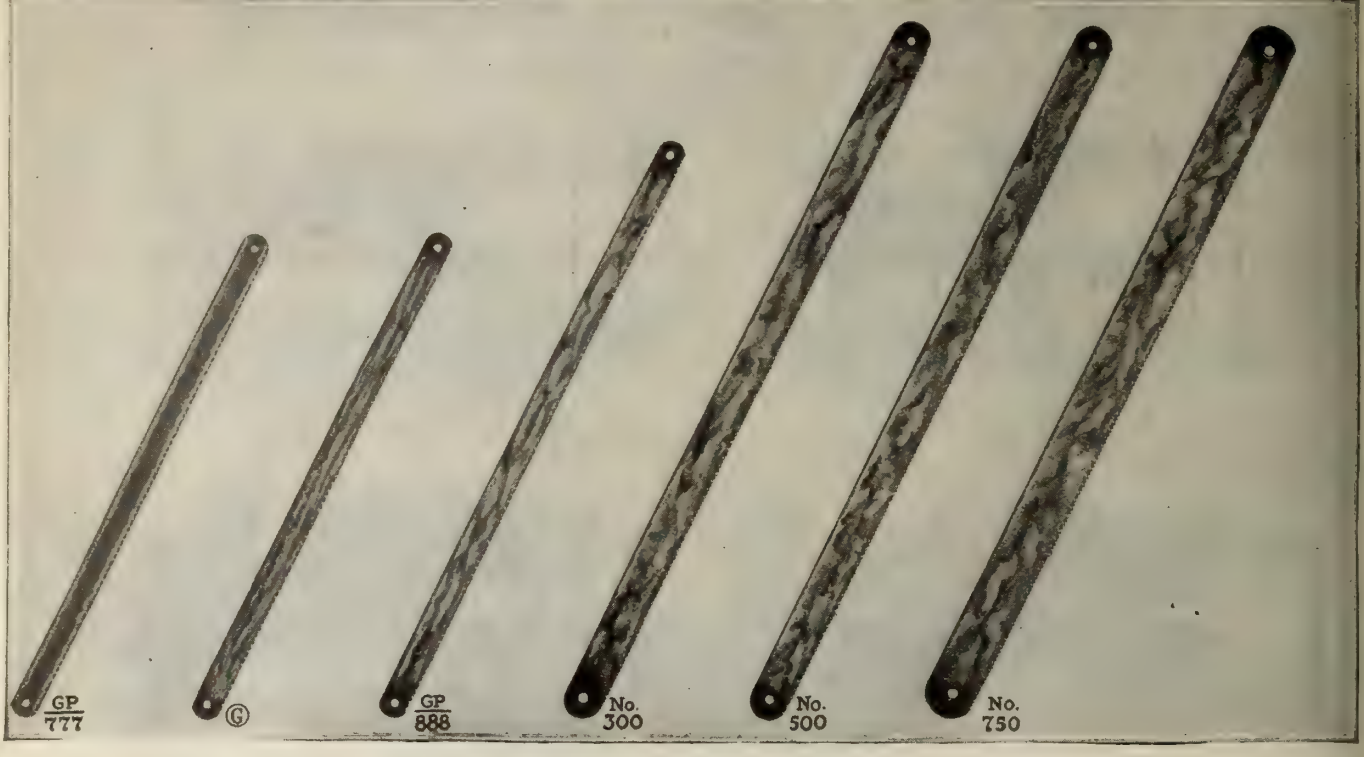
In this Foster new line of Screw Machines an ample margin of power and rigidity has been added above the maximum requirements with a view in mind of taking care of and providing for additional improvements in cutting steels that may be brought to the front during the next few years to come. This has been done without making the machines unnecessarily heavy and without in any degree sacrificing the ease of control of operation.

The halftone shows the design of the friction head for the Nos. 3-5 and 7 Screw Machines. The gear covers have been removed in order to more clearly show the design.

The powerful friction clutch mounted on the spindle between the cone pulley and the friction gear serves to engage the spindle into driving connection direct with the cone pully on one side or with the back gears through the large diameter spindle gear on the other hand. The frictions are of the cone pulley type and are operated by the hand lever through the medium of a large movable sleeve and four fingers mounted on the spindle. The friction is very sensitive in operation and extremely powerful.

The spindle is made of a high carbon steel forging and is journalled in liberally proportioned bearings made of a special high-grade bronze.

The head is cast integral with the bed. The rigid double girder type of bed is very heavily ribbed internally and is designed throughout to gain the maximum rigidity without the use of unnecessary large amount of cast iron.



We have ready for instant distribution circulars of each size of Screw Machines. These circulars also describe our excellent and comprehensive new line of Screw Machine tools for each size of machine.

Write for these circulars.

GOODELL-PRATT
1500 GOOD TOOLS

Hack-Saw Blades

Goodell-Pratt Hack-Saw Blades are the best it is possible to manufacture. They are made of the highest grade of hot-rolled sheet steel and tempered with the greatest care. Every blade undergoes rigid inspection after each manufacturing operation.

It is impossible to get satisfactory service from a hack-saw blade unless it is suitable for the work to be done. Goodell-Pratt Hack-Saw Blades are made in enough different sizes and pitches to enable anyone to select just the right blade for the job.

Goodell-Pratt quality is as evident in these hack-saw blades as it is in all of the 1500 Goodell-Pratt Tools. The materials used, the skilled workmen employed, and the great care exercised combine to make Goodell-Pratt Tools known the world over for their excellence.

Write for a complete pocket catalog of the 1500 Goodell-Pratt Tools.

STOCO

SAFETY GOGGLES

"CELOGLAS"

SHATTER-PROOF LENS

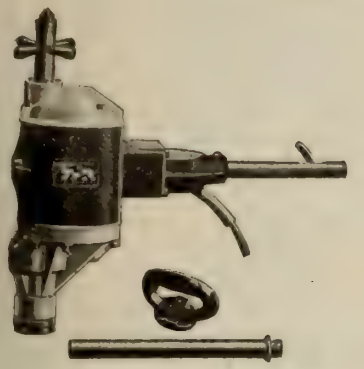
Increased production, reduced labor turnover, better workmanship and closer co-operation from employees are a few of the advantages which follow elimination of the industrial eye hazard.

In other words, viewed from a purely dollars-and-cents profit-and-loss angle, equipping with Stoco Safety Goggles every worker who is doing eye hazardous work in your plant is a profitable proposition.

Price per hundred (f.o.b. Geneva, N.Y.), with extra heavy optical glass lenses, $90.00

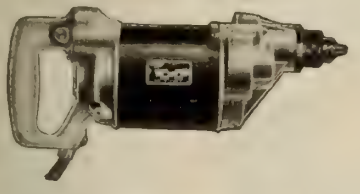
With Celoglas Shatter-proof Lenses $115.00

Of course, we sell in lots of less than a hundred. We also give interesting discounts for quantity orders.



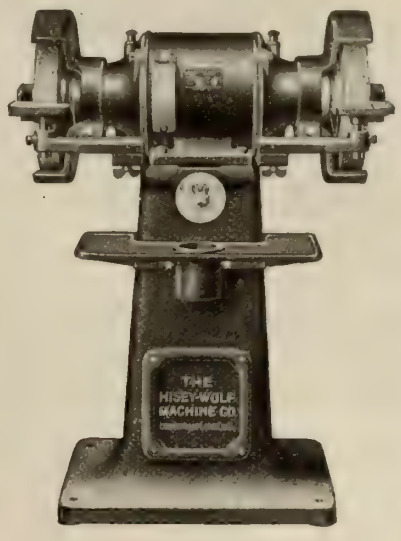
A sample of the Stoco Safety Goggle will be sent interested responsible people on receipt of request on letterhead.

STANDARD OPTICAL CO.

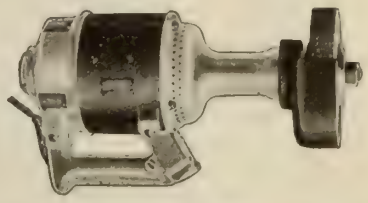


GENEVA, N.Y. U.S.A.

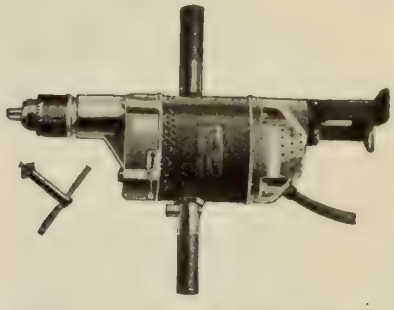
HISEY
Electric Machine Tools



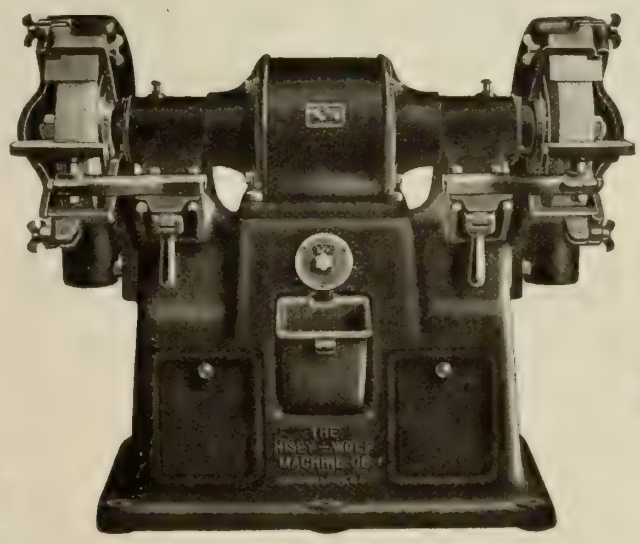
For all requirements from the lightest to the heaviest where power and dependability are essential.



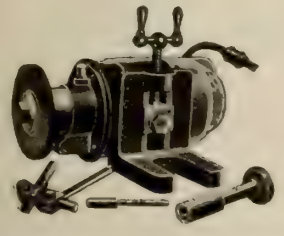
Heavy Duty Drill and Reamer, made in seven styles and sizes up to 1¾″ drilling capacity.



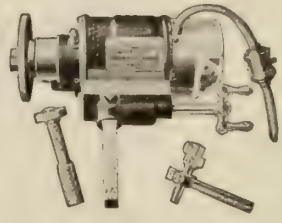
Electric Hand Drill. Made in 3 sizes — 3/16″, ¼″ and 5/16″ capacity.



Ball Bearing Floor Grinder. Made in following sizes:—
½ H.P. with 8x¾″ grinding wheels
1 H.P. with 10x1″ grinding wheels
2 " " 12x1½″ " "
3 " " 14x2″ " "



Portable Hand Grinder. Made in 5 sizes—¼ H.P. to 3 H.P.



Hand and Breast Drill. Made in single and two-speed designs in ⅜″, ½″ and ¾″ capacities.

Angle Plate Roll and Surface Grinder. Made in 5 sizes—¼ H.P. to 3 H.P.

Ball Bearing Floor Grinder. Made in 5 H.P. and 10 H.P. sizes. 5 H.P. recommended for 18x3″ wheels—10 H.P. recommended for 24x4″ wheels.

Lathe Centre Grinder. Made in ¼ H.P. and ½ H.P. sizes.

HISEY products are systematically designed and BALL BEARINGS are used where applicable.

THE SIDNEY MACHINE TOOL COMPANY

SIDNEY

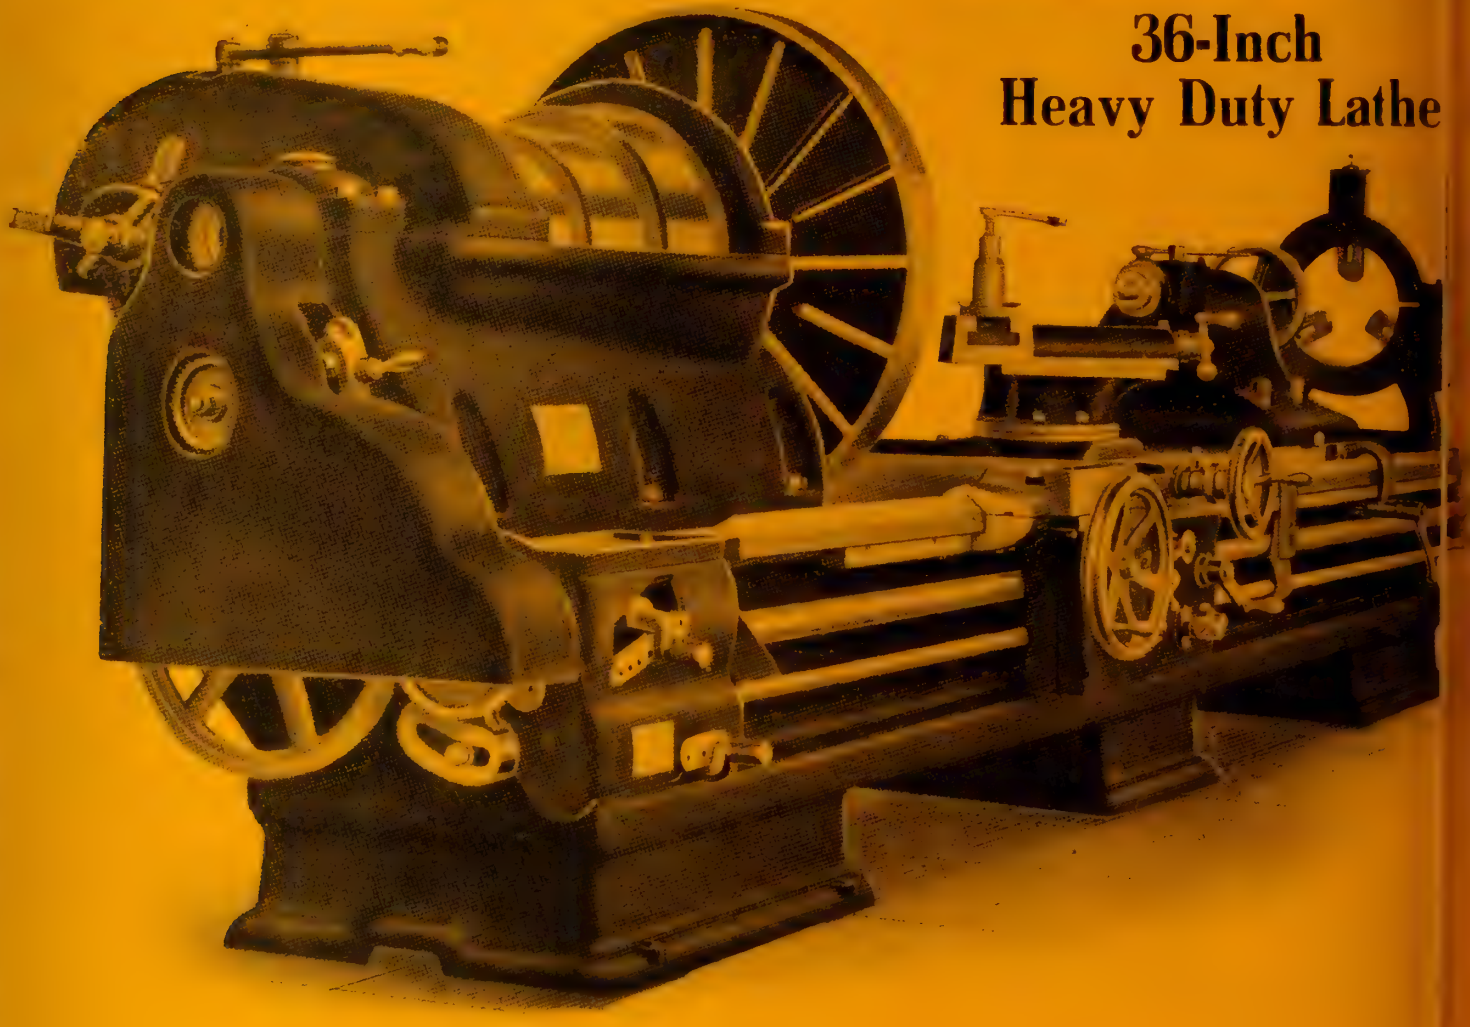
HIGH DUTY 17 INCH LATHE

SIDNEY SERVICE

A producer of the first quality in accurate, heavy duty manufacturing—ready at all times to meet the most exacting demands of modern shop practice.

All the modern improvements in lathe design evolved by the strenuous demands of hard service have been embodied in Sidney Lathes.

Some features of this machine which have adapted it to heavy duty work: Closed type headstock offset from centres. 50 point carbon steel spindle, phosphor bronze spindle bearings and sight feed oil cup on front box. All other bearings fitted with Brown & Sharpe oil plug. Tail stock of improved rigid split type. Bed very heavy and deep, cross braced with double wall cross girts spaced 2 feet apart. Ways of semi-steel, causing all wear to occur in the carriage ways where it does not affect alignment. Bridge of unusual width and depth. Rigid compound rest graduated in degrees. Apron provides double bearing for all pinions and gears. Quick change gear box is a complete unit, with high carbon steel cut gears, providing a wide range of threads and feeds immediately obtainable.



May we send our catalogue?

THE SIDNEY MACHINE TOOL CO.

SIDNEY, OHIO, U.S.A.

SID

36-Inch Heavy Duty Lathe

The biggest and heaviest lathe in our line. A massive, powerful machine in which is embodied all that is best in material and workmanship—all the niceties and improvements of correct modern design which make even a machine of this size all it should be. As unfailingly accurate as a jewelled watch—as rigid and inflexible as the Rock of Gibraltar.

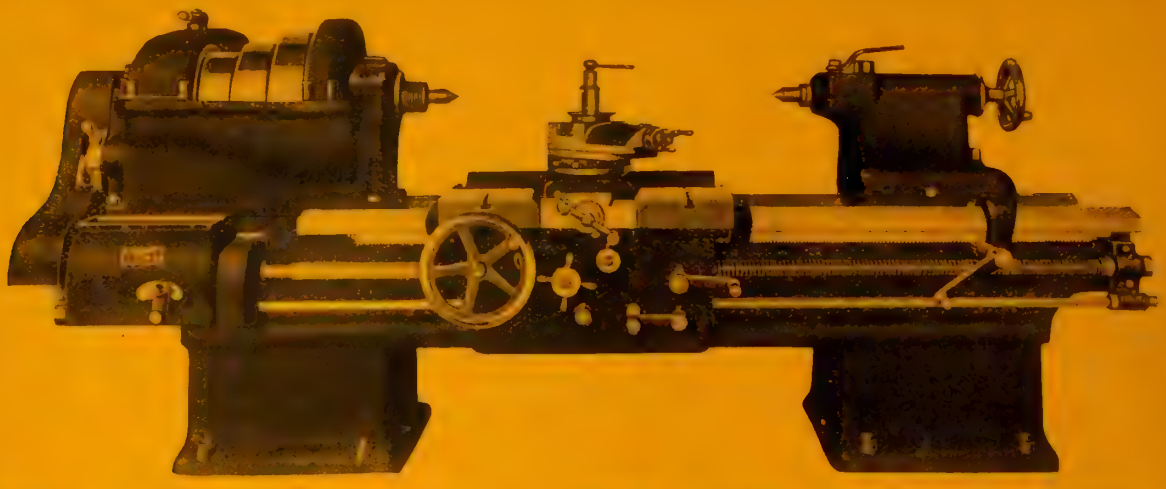
May we send Catalog?

THE SIDNEY MACHINE TOOL COMPANY

SIDNEY, OHIO, U.S.A.

NEY

16-Inch
Medium Pattern Lathe



The 16-inch Medium Pattern Lathe is built in 6, 8, 10 and 12 foot bed lengths. It is a splendid machine for the toolroom, or for lighter manufacturing work than is handled by our heavy duty line. This lathe possesses every refinement of detail in design and workmanship to fit it for this work, where sustained accuracy for a great length of life is essential.

Three-step cone, double back-geared headstock. Casting webbed above centre line of spindle, forming rigid support for journal boxes. High carbon steel spindle bored for large hole its entire length. Bed unusually wide and deep, rigidly braced with cross box grinders, with semi-steel ways. Carriage ways are best grade cast iron. Wear comes on carriage thus retaining alignment. Heavy, substantial carriage bridge, very heavy compound rest, micrometer dials, thread indicator, etc. These are only a few of the distinctive features of this lathe. **Let us send you full specifications.**

THE SIDNEY MACHINE TOOL COMPANY

SIDNEY, OHIO, U.S.A.

THE SIDNEY MACHINE TOOL COMPANY

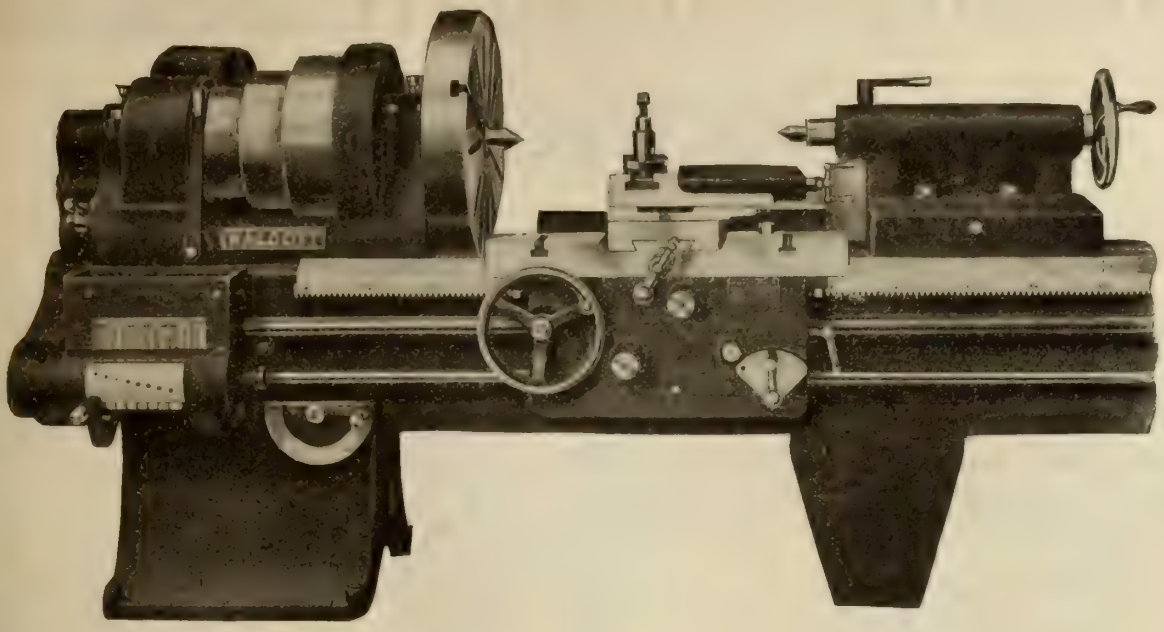
SIDNEY

25 inch Heavy Duty Engine Lathe

SIDNEY SERVICE

A massive, powerful tool that will handle the heaviest and toughest work in its range with surprising ease and speed. A heavy duty machine, one with built-in qualities that ensure lasting accuracy and rigidity. Economical of floor space and convenient to handle.

Built with quick or semi-quick change gear box in beds of 10, 12, 14, 16, 18 and 20-foot lengths.



Here are some of the modern facilities which have ensured the superiority of this machine for heavy duty manufacturing work:

Closed type headstock offset from centres. Spindle ground from 50-point carbon crucible steel forgings. High composition bronze spindle bearings, equipped with oil cups. Lathe bearings fitted throughout with oil plugs. Unusually deep and heavy bed, rigidly supported by heavy double wall box section cross firths. Legs set in from end of bed, reducing span and deflection under cut. Outer ends of bed supported by cantilever form of construction. This arrangement reduces floor space and weight and increases the rigidity of the bed. Massive tailstock of improved rigid split type with positive clamp bolt. Carriage scraped to bearing on V's its entire length. Bridge of unusual depth and width. Apron gives double bearing to all gears and front plate can be removed for adjustment of parts without removing apron or carriage. Rigid compound rest with swivel graduated in degrees. Lead screw cut with 2 pitch thread. Quick change gear a complete unit, with high carbon steel cut gears and convenient dials and operating levers.

Walcott Lathes—Time Tested

It did not take 38 years to establish a reputation, but you can benefit by that experience.

YOU can subject this 26″ Engine Lathe to any test and at the outcome you will find that 38 years of lathe building have enabled us to present a machine that answers the most rigid requirements.

Reinforced and strengthened at the points of stress, this machine includes such features as: double apron plate, drop forged gear in apron, rigid compound rest, back gear arm reinforced by one-piece gear guard and headstock, not a single tooth exposed, feed gears run in oil, large frontway on bed, and quick change gear box. The lead screw and feed rod are separate.

Made in 14″, 16″, 18″, 20″, 26″, and 29″ sizes.

Our experience and co-operation are entirely at your disposal. Write us.

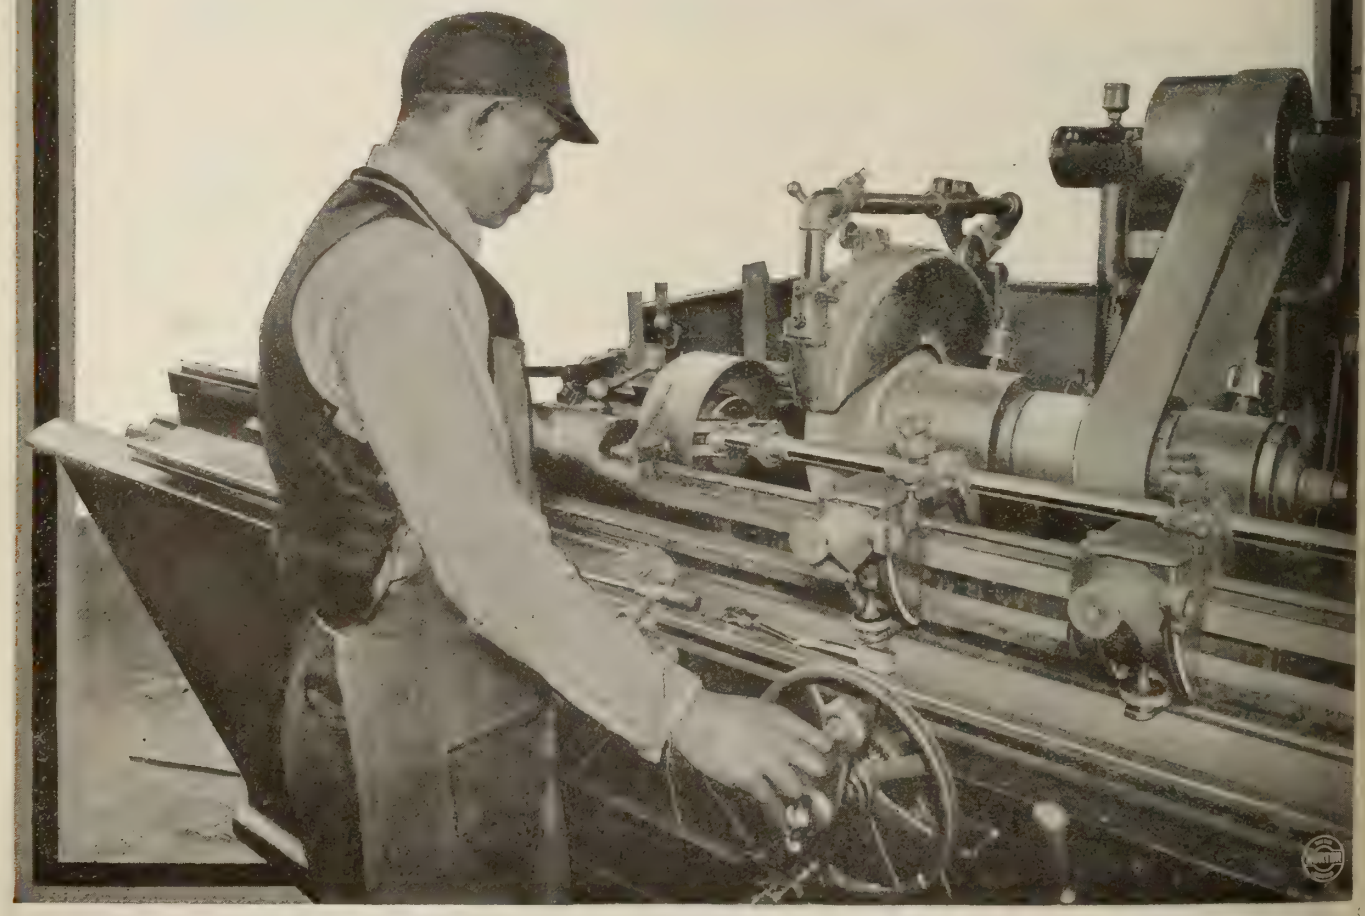
Grinding Camshaft Bearings for Electric Trucks

This operation requires a grinding wheel that will produce a finishing cut on the three bearings of a 38-inch chrome nickel steel camshaft to a total limit of .0005. A 3846 combination M Alundum wheel has been producing satisfactory results on this work for some time. The roughing cut is taken on a lathe leaving from .025 in. to .040 in. for grinding. In this manner the bearings were finished in very much less time than formerly when all the work was performed on a lathe.



When the right machine and wheel are selected the reward is greater production.

Maybe You Won't Believe This

WE won't blame you much if you don't—at first. For it is the record of one of those things which "simply don't happen."

Yet it ***did*** happen. And you ***will*** believe it when you check us up on the facts.

In one of America's foremost plants one of the machine jobs involves milling steel forgings with a side milling cutter, 7 x ¾ x 1¼ inches.

Exhaustive tests were made in the effort to improve upon 10 inches a minute table feed which had been the standard. These tests resulted in an increase to 20 inches a minute; the maximum with any of the cutters then available.

But along came Davidsonized Steel. A Davidsonized cutter of the same size and type as the others was tried out under the same conditions. ***It maintained a speed of 32 inches a minute.***

Davidsonized Steel Tools increased production in this plant 220 per cent. over the standard rate and 60 per cent. over what had been considered the maximum.

You, too, have some operation on which Davidsonized Steel Tools can speed up your production to a like or even greater degree. A test will cost very little and may save you many dollars in production costs.

When every day of using the old kind of tools is holding back your production—costing you money—why not let us prove our statements in your own plant. A letter will bring full particulars.

Special Service to Concerns Who Make Their Own Tools

We will supply Davidsonized High Speed Steel Blanks, semi-finished to within approximately .015 to .020, either soft annealed or hardened.

DAVIDSONIZED HIGH SPEED STEEL TOOLS

This 18-inch Spartan Double Belt was installed July 1917 in the plant of the Western Malleables Co., Beaver Dam, Wis. It has been frequently exposed to steam without injury.

This Husky Belt Stands Steam

STEAM quickly plays havoc with most belts. Not so with this Spartan Leather Belt, which for more than two years has been frequently exposed to this destructive agency.

Why? Because it is made of Spartan Leather—a specially tanned leather which resists exposure to steam, oil, chemical fumes, heat, and other conditions which quickly destroy ordinary leather.

The greater load-carrying power of Spartan is due to its unusual pliability and high co-efficient of friction.

With production costs at unheard-of levels, Spartan's wonderful efficiency is of more interest to you to-day than ever before.

Spartan is one of the Graton & Knight Standardized Series Leather Belts. In that series, there is a belt standardized for every drive. Write for our book, "Standardized Leather Belting."

The advice of our Engineering Department is at your disposal on any power-transmission problem. Ask us questions about belts and their uses and treatment.

MANUFACTURING NEWS

Vol. XXIII., No. 6 February 5, 1920

The History and Manufacture of the Telephone

When You Use the Telephone, Do You Realize the Work Entailed in Its Manufacture? The Fundamental Principle of Telephony, With the Manufacture of the Conductors, Etc., Are Explained

By G. C. BROWN*

THE telephone has become so available and its use is so habitual with the majority of us, that we accept it as a necessary part of our daily scheme pretty much without comment, forgetful of the fact that our great grandparents did not know the blessing of a telephone and transmitted their communications either by means of messengers or through the medium of letters written in longhand. Whenever we speak into our office or home telephones and hear the reply coming back from a distance of one hundred or a thousand miles, a marvel is enacted before us, which makes all previous accomplishment in the field of communication look small and ridiculous. In the year 490 B. C., a Greek runner carried to Athens the momentous tidings of the victory of the Greek General Miltiades over Darius and his Persian host on the field of Marathon. The athlete completed the distance of twenty-six miles in something over two hours, delivered his glad tidings and then fell dead. If Miltiades had possessed a field telephone connecting the Grecian camp with Athens, he could have communicated the news of his victory in two minutes and the runner's life would not have been sacrificed. Comparisons of this nature bring home to us something of the debt that we owe, both to the man who invented the telephone and to those who during the past forty years have labored to improve it.

It is just forty-three years since Alexander Graham Bell exhibited his telephone at the Philadelphia Exposition of 1876. The telephone of to-day does not greatly resemble this first working model which was a crude affair that would barely transmit speech over short distances. A succession of developments, following each other with bewildering rapidity, have given us first long distance or toll lines, next the automatic telephone and as a final triumph, the wireless telephone.

While this rapid development has brought untold benefit to our twentieth

*Associate Member Am. Soc. M. E.

FIG. 1—MAIN FACTORY AND GENERAL OFFICES. NORTHERN ELECTRIC COMPANY, LIMITED, MONTREAL.

century civilization, it has carried with it the disadvantage that time has not been provided for the preparation of standard text books on telephone manufacture. In other fields of scientific development, notably the application of steam and electric power to industry, there have been periods of quiescence or breathing spaces during which a comprehensive literature has been created and kept reasonably up-to-date. The history of the telephone, since its inception, has been one of constant change and manufacturing practice has had to undergo a corresponding process of continual readjustment. A number of excellent books on the telephone have been published. These, however, are devoted chiefly to elucidation of the principles underlying telephony and to the design of the telephone and its auxiliary equipment. Problems of manufacture are either not touched upon, or at best are dealt with in a perfunctory manner.

In order to successfully manufacture telephones from day to day, peculiar problems in almost all branches of applied science and economics have had to be attacked and solved, and to this list, which I will not trouble to enumerate, have recently been added problems in Sociology and Vocational Training.

Fundamental Principle of Telephony

In order that the various steps in telephone manufacture shall be properly comprehended, it is desirable that we dwell briefly on the fundamental principle which makes the telephone possible, and also on the "modus operandi" of a telephone system. The telephone in its most elementary form includes two units, each consisting of a transmitter and a receiver, situated apart, and interconnected by means of two electric wires into which a delicate electric current is automatically switched when the receiver is raised from its hook. The transmitter or "speaking" part contains a circular metal diaphragm,, sufficiently thin, and so placed that it will vibrate under the influence of the human voice. In the transmitter the current must pass through a small box of granulated carbon before reaching the line wire, the transmitting diaphragm forming the outer or "mouthpiece" side of this box. When the transmitting diaphragm vibrates under the influence of sound, it controls the current passing through the carbon and into the line. The receiving or "listening" part of the telephone contains a permanent magnet with both its poles in close proximity to a circular metal disc similar to that in the transmitter. The fundamental priciple of the telephone consists of the control of the delicate electric current in the line by means of the vibrating transmitter-diaphragm, the variations in current thus produced passing over the line and into the magnet of the distant receiver. The energising effect produced on this magnet sets up sympathetic vibrations in the receiver diaphragm, which when held to the listener's ear, reproduces the sound or sounds registered into the distant transmitter.

This simple description applies to a condition where communication is provided between two telephones only. In a telephone system, however, there are many hundreds of telephones, all of which must be interconnectable. This difficulty is solved by bringing all the telephone wires into one central exchange and having them terminate at a switchboard, a socket in the board marking the terminus of each line. An operator in the central office or exchange is now able to temporarily interconnect any two sockets by means of flexible interconnected wires or, as they are termed, "cords," each equipped at one end with a metal plug. By placing one of these plugs into the socket corresponding to one telephone line and a second plug into another socket, both phones become directly connected to each other and communication is established. This provides for the connection of any two lines on the switchboard, but does not provide a connection between the exchange operator and the distant telephone which is seeking a connection. It has, therefore, been found convenient to have additional sockets placed in front of the operator, and to carry branch lines from her main line to these sockets which are termed "answering jacks." One of these "answerin jacks" is, therefore, provided for each telephone connected with the exchange.

In order that the exchange operator may know when one of her subscriber wishes to speak to her, a miniature electric lamp is placed beside each "answering jack." This lamp is automatically switched on when the calling subscriber raises the receiver from its hook, and when "Central" has made the desired connection, it is automatically switched off. The switchboard also has "ringer" keys and the operator by depressing one of these keys, which are situated in front of her, can ring any subscriber's telephone, and in this way signal the fact that connection is established with another subscriber. The term "subscriber" by the way covers anyone who has rented telephone service from the Telephone Company and is, therefore, connected up to an exchange.

The conductors which serve as the carrying medium in a telephone system, naturally constitute a very important part of the system. Under the heading of "Conductor" are included, first — the large telephone cables, either underground or aerial, which are used in congested area, or for long distance transmission between cities, or for connecting up exchanges. The chief advantage following the use of a cable lies in the fact that is compact, and serves as a container for a considerable number of telephone circuits or individual lines. Telephone cables are made up of annealed copper wires, each wire insulated with spiral wraps of paper. Two of these conductors are then twisted together to form a "pair." The required number of pairs are then stranded into the form of a cable and covered with paper wrapping. This cable or "cable core" as it is termed at this stage, is next dried, and as a final operation, is covered with a protective metal covering or "sheath," consisting of an alloy of either lead and antimony or lead and tin. These steps

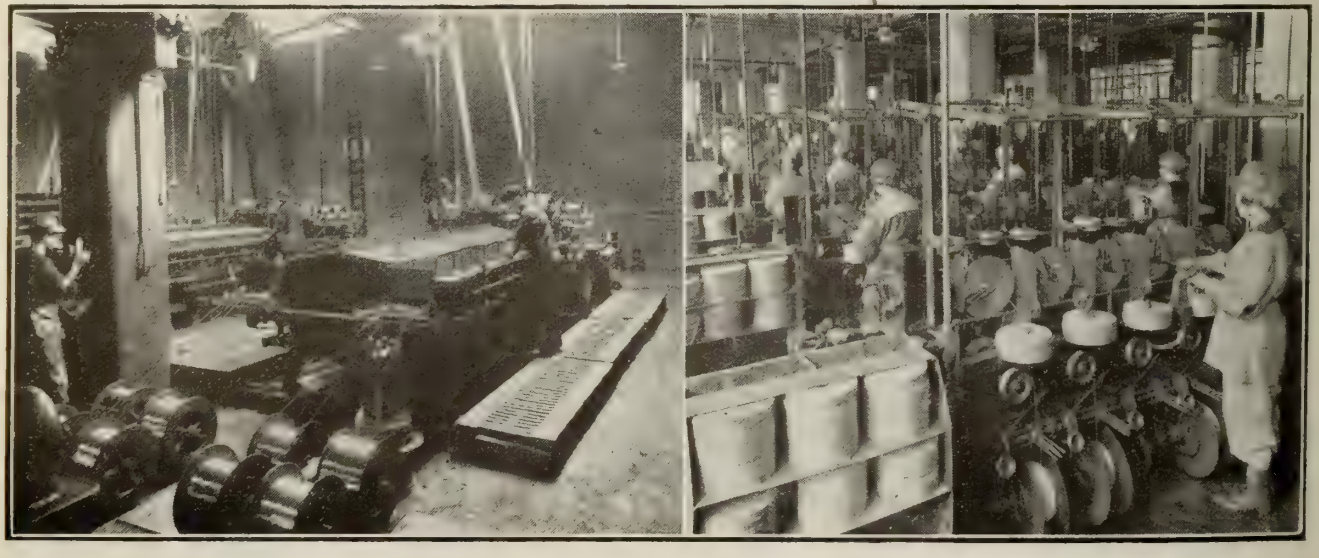

FIG. 2—DRAWING WIRE OR WIRE-DRAWING MACHINES.

FIG. 3—FIVE HEAD TELEPHONE INSULATOR MACHINE USED FOR PAPER INSULATING TELEPHONE CONDUCTORS

in cable manufacture will be dealt with in more detail later on.

Under the heading of "Conductors" are included next the various feeder or distributing wires, so termed because they serve to distribute telephone service from the larger cables to public or private buildings. These wires are used between poles and houses, and at the house entrance connect into other conductors known as inside wires. Both of these forms of conductor are insulated with rubber, over which is braided one or more layers of cotton, and if the conductor is to be exposed to the outside weather, it is impregnated with a weatherproof compound which serves to greatly increase the durability of the insulated covering.

Next we have the switchboard wires which, as the name suggests, are used in the wiring of telephone switchboards at the exchanges, then the distributing frame or "jumper wires," which provide a connecting link between telephone cable and switchboard; then the flexible cords used in making the switchboard plug connections, and which are also used as the local connection between telephone and ringer; and lastly, the fine silk or cotton covered magnet wires used for winding about relays, induction coils, etc.

Manufacture of Conductors and Telephone Apparatus Conducted Separately

In order that telephone service be brought within the reach of humanity, therefore, it is necessary to manufacture:

First—Telephone conductors, including cables, telephone wires, magnet wire, switchboard wire and cable, distributing frame wire and flexible cords.

Second—Telephone apparatus, including the assembled switchboard, distributing frames, receivers, transmitters, signalling apparatus, etc.

I have placed the conductor first, because the assembly of numerous pieces of telephone apparatus pre-supposes the existence of various forms of conductor. Induction coils for instance must be wound with magnet wire before they can be assembled into telephone apparatus. The switchboard, before it can be assembled in permanent form, must have the necessary switchboard wires, distributing frame wires and flexible cords. The manufacture of the conductor in a certain sense precedes the manufacture of the telephone apparatus.

FIG. 6—TWO ROWS OF NEW ENGLAND BUTT BRAIDERS. EXTERNAL BRAIDING SILK AND GLAZED COTTON ON FLEXIBLE CORDS

Until quite recently it has been considered desirable to manufacture conductors and telephone apparatus through separate organizations, chiefly owing to the fact that from the production standpoint there are marked points of dissimilarity between the problems involved. The building up of a telephone cable, for instance, is a synthetic operation in which, starting with a copper wire base, something is added at every stage until, at the end of the last stage, we have the finished cable. This same idea applies to the manufacture of all conductors. The types of machines used, moreover, are peculiar to that class of work, and in many cases have been developed to perform a definite operation. Under this heading are included insulators, twisters, stranders, etc. The manufacture of telephone apparatus is characterized by a constant flow of small parts towards a final assembly, the machines used being largely the conventional type found in all factories, lathes, screw machines, punch presses, etc.

While practice has until very recently kept the manufacture of conductors and the manufacture of telephone apparatus distinct, the manufacturing operations for the two classes of work being performed through separate organizations and in separate factories, this is in process of change, and the entire manufacture of the telephone is gradually being brought under one functional organization. In outlining the manufacturing operations, however, we will observe the division mentioned, and will proceed, first, with a brief description of the operations incidental to the manufacture of cables, wires and cords, as performed

FIG. 4—LARGE TELEPHONE STRANDER SHOWN STRANDING UP A TELEPHONE CABLE.

FIG. 5—THIRTY-INCH LEAD PRESS AND MELTING KETTLE. TELEPHONE CABLE CORE BEING COVERED WITH LEAD

in the Shearer Street factory of the Northern Electric Company.

The Manufacture of a Telephone Cable. Wire Drawing

The first stage in the manufacture of a telephone conductor consists of drawing the copper wire to the desired gauge, wire for use in telephone cables being in most cases drawn to a finished diameter of either Nos. 19 B & S or 22 B & S gauge (.036 in. and .025 in. respectively). The drawing of copper wire is rendered possible through the property possessed by that metal of permanent extensibility with a corresponding reduction in cross-sectional diameter, when a rod rolled from a copper ingot is pulled through a die, or a number of dies, the inside diameter of which corresponds to the diameter of wire desired. The wire-drawing operations are performed on various types of machines, the details of these varying in accordance with the fineness of gauge required in the product. All wire-drawing machines, however, fall into one of two general classes depending on whether one die, or more than one die is used in a single drawing operation or "pass." These two classes are:

(a) Single Block Machines.—When one die is used, effecting a single reduction in the diameter of the wire.

(b) Continuous Machines.—When a number of dies, effecting simultaneously a series of reductions are used.

All telephone conductors are drawn on continuous machines, and magnet wire as small as No. 40 B & S gauge (about the same diameter as a human hair) is produced daily. The die used in wire drawing may be a piece of chilled iron, or for finishing gauge it may be a diamond or a ruby. The object of utilizing precious stones is to enable the dies to be used for a considerable time without losing their size and so producing wire of incorrect diameter.

The mechanical action or wire-drawing has the effect of hardening the wire, this rendering it unworkable, and also impairing its electrical properties. It must therefore be annealed at intervals during the progress of drawing. The annealing operation at the Northern Electric Co. is accomplished in large gas-fired furnaces served by two gas producers.

Fig. No. II shows one of the Northern Electric Company's continuous wire-drawing machines.

Insulating and Twisting

If the wire is to be used in the manufacture of lead-covered cables, it must, after having been drawn to the correct gauge, be insulated with a wrapping of paper. This operation is accomplished on high-speed insulators, the paper being spiralled about the wire, which travels through the machine at a high rate of speed and in finally wound about iron reels known as "take-up reels." Each insulator is equipped with five insulating heads arranged in such a way that five parallel wires pass through simultaneously. A girl attends to all five heads as shown in Fig. III.

The insulated wires are next twisted into pairs, this operation being performed on high-speed twisters. The twisted pair obtained at this stage provides a single telephone circuit. The twister heads, sometimes termed "fliers," turn at a speed of 500 r.p.m., the twisted wire being taken up on large metal take-up reels in readiness for the operation of stranding which follows next in the sequence.

Stranding

From the high speed twisters we have an accumulation of reels of insulated and twisted pairs, each pair a distinct telephone line. These twisted conductors must be bundled into the compact form of a cable, and as a cable frequently contains as many as nine hundred telephone lines, the bundling or stranding machine must be somewhat elephantine in design.

By referring to Fig IV, showing one of the Northern Electric Company's large telephone stranders, two outstanding features will be observed. First, that a strander occupies considerable longitudinal floor space, and second, that the reels of twisted pairs are loaded upon it in a cluster-like arrangement throughout its entire length. A telephone strander consists of a number of hollow cylindrical sections, known as strander drums, each section accommodating a certain number of reels of twisted pairs, and as a cable during the progress of stranding is increasing in diameter throughout its length, the capacity of each strander drum for these reels is successively greater than the one before it.

When the reels are in position on their respective shafts, the end of each twisted conductor is threaded through an eyelet, all the conductors converging then towards a central die, one of the latter being in place before each strander drum. The various drums are then placed in operation and revolving in alternately opposite directions, bundle the cable into compact spiral layers. As the stranded cable emerges from the last strander drum, a layer of cable paper is wrapped about it in regular convolutions, the cable at this stage being known as a "cable core." (It does not, by the way, attain the full dignity of a finished cable until lead covered. The cable core is finally taken up on a vertical drum mounted on a truck termed a "core truck," and when the latter is full, it is removed from its position in front of the strander and an empty core truck substituted.

Testing for "Crosses" and "Opens"

It frequently happens that the paper insulation about individual conductors is not continuous and that through some accidental circumstances there is at some point in a length of stranded cable an uninsulated or "bare" spot. If two of these bare spots occurring in adjacent conductors are squeezed into contact with each other, the resulting condition is termed a "cross." It frequently happens, also, that, owing to the necessary tension on conductors during stranding, one or more of these are broken, the cable under these circumstances emerging from the strander with certain conductors not continuous. This second condition is known as an "open." If a cable containing either of these defects were permitted to leave the factory and be placed in service, the result would be a short circuit through the crossed conductors, and no circuit through the open ones. It is very important, therefore, that all telephone cables be carefully tested for these faults, and this test is conducted immediately after stranding by connecting the pairs one by one with an electric bell or buzzer, and ringing them out. If a cross or an open is found through the failure of certain pairs to ring out in a satisfactory manner, the exact location of the defect must be established, this being accomplished by means of a Wheatstone bridge. When the faults have been located, the paper wrapping is removed from the cable at this point and if the fault is a cross, the conductors are properly insulated apart; if an open, they are brazed together.

Drying the Cable Core

The next operation is that of drying

FIG. 7—BENCH WORK ON FLEXIBLE CORDS. GIRLS BINDING ENDS OF CORDS AND SOLDERING METAL CONNECTIONS INTO PLACE.

or desiccating the cable core in order to expel all moisture. The loaded core trucks are now wheeled to large steam-heated drying ovens, where the cable is exposed to a drying heat for a period ranging from twenty-one to forty-two hours, this period governed by the size (number of pairs of the cable).

The elimination of moisture from a cable by drying has the effect of greatly increasing the transmission efficiency of its component pairs by controlling two electrical properties known technically as "electrostatic capacity" and "insulation resistance." The electrostatic capacity of a dried cable is low and uniform, while its insulation resistance is very much higher than that of an undried cable. Moisture, while not a good conductor of electricity, is nevertheless a conductor, and if permitted to remain would cause a condition similar, in a sense, to the fault described as a "cross," thus creating local interference throughout the cable when placed in service.

Lead Covering

After drying, the cable core is covered with a protective lead pipe or sheath, the thickness of which varies from 1-32 to ¼ of an inch, depending on the diameter of the cable core. The core truck with its load of cable core is transferred, after the drying operation, to another oven situated behind a large hydraulic press, the latter equipped with a hollow core-tube and forming die, and driven by a multi-speed pump. Immediately above the assembly of core-tube and die is placed a lead cylinder or container into which molten cable sheath alloy, consisting of lead plus a small percentage of either antimony or tin, is run from an independent melting kettle. The lead cylinder is first charged with molten alloy, and the charge permitted to cool to plasticity. The hydraulic press is then placed in operation and forcing the plastic alloy into contact with a vertical ram, squeezes it out between the core tube and forming die, at which point it comes in contact with the cable core, the end of which has previously been thrust into the hollow part of the core tube. The cable sheath thus forced through the die, grips the cable core and carries it along, the lead-covered cable as it emerges from the press being reeled up on large wooden cable reels.

The operation of a lead press requires considerable skill on the part of the workmen employed, as the cable sheath must be perfectly concentric throughout its length. The usual gang consists of an operator, who attends to the running of the press, and a helper who attends to the charging of the melting kettle and press cylinder and also sees that the cable is being properly reeled up on the take-up reel.

A sense of proportion in regard to this operation will be gained by glancing at Fig. V. which shows a 30-inch lead press extruding cable sheath.

The cable, from the manufacturing standpoint, is now complete, and passes next to a rigid final inspection. If it comes through this ordeal in a satisfactory manner, it is pronounced fit for shipment and is encased on the cable reel by means of wooden lags, after which the reel is transferred to the shipping platform.

The Manufacture of Rubber-Covered Telephone Wires

The distributing wires or "feeder" lines which form the connection between poles and house entrances and the inside wire running from the house entrance to the telephone, have no protective lead covering as in the case of large underground cables. In order that the individual conductors shall be properly insulated apart and moisture-proof, it is necessary that they be rubber covered. The Northern Electric Company therefore maintains complete equipment for the compounding and manufacture of rubber, and also machines for encasing the conductor in its rubber covering. Two types of machine perform the latter operation. One, a "strip insulator," equipped with a grooved die, which presses longitudinal strips of rubber about the conductor. The other, a "tube insulator," which extrudes the rubber through a core and die in much the same way that a lead press extrudes the metal sheath about a cable core.

The manufacture of the rubber used for insulating purposes is in itself a veritable science, and gives rise to many special problems. The rubber is received in crude form from forests and plantations in the tropics, and must undergo a cycle of preparatory operations before it can be used for insulating purposes. First it must be washed for the removal of foreign matter. Next it is hung up in long strips and subjected to a slow drying process. Then it is mixed or compounded with other materials which are added in various proportions, in order that the final compound will possess the proper physical characteristics. One of the most important materials used in compounding is sulphur, the vulcanizing constituent of all rubber compounds, which, when added, tends, under the influence of heat, or as it is termed "a cure," to interact chemically with the rubber and greatly increase its physical strength.

If the rubber is to be used for strip insulating purposes, it passes, after mixing, to calender rolls, where it is pressed into thin sheets, which are cut into strips of a suitable width for the strip insulator. If it is required for tube insulating purposes, it is rolled into heavier sheets, which are then cut into thick strips and fed into the forming die of the tube-insulating machine.

In order that sulphur in the rubber compound will not interact chemically with the copper conductor, the latter after wire-drawing, and before insulating, is coated with tin, by passing it through a molten bath of that metal. After the conductor has been strip or tube insulated, it is subjected to a steam or a dry cure, the nature and effect of which have been referred to. It then passes to a braiding machine, and is covered with an external braid of cotton, through which is run a thread of another color known as a "tracer" and used for identification purposes.

Figure No. III shows a double row of braiders working on flexible cords. It will be observed that the braider consists of a horizontal table, with individual vertical spindles or "carriers" provided for each spool of cotton or silk, and that the wire passes vertically from a give-up reel into the machine, receives its braid, passes about an overhead capstan, and finally down to a take-up reel situated near the floor. Interesting details in the construction of a braider consist, first, of a mechanism whereby the braider automatically stops if a single thread breaks while it is in operation; and next, the

FIG. 8—MULTIPLE SWITCHBOARD IN A CENTRAL EXCHANGE.

fact that two or three distinct layers of braided insulation can be simultaneously braided by using a braider with double or triple decks of carriers. On certain types of wire, one girl can, without difficulty, operate as many as forty-five of these machines.

After braiding, the conductor is impregnated in dielectric or weather-proof compounds and is polished mechanically. Two wires are then twisted together to form a pair. A careful inspection follows, after which the twisted pair is coiled into the desired length, the coil is tied with tape and finally wrapped with paper or packed in boxes ready for shipment.

Telephone and Switchboard Cords, Magnet Wire and Switchboard Wire and Cable

The green telephone cord, a familiar part of our office or home telephone equipment, and the switchboard cord, which enables the exchange operator to make her myriad of daily connections, differ from the forms of conductor which we have hitherto considered, in that the conducting element of a cord is not a solid copper wire, as in the previous cases of telephone cable and rubber covered wire. It is obvious that the most important characteristic of a cord in service must be perfect flexibility combined with sufficient durability. Tinsel threads are therefore twisted together, and these instead of a solid copper wire form the conductor. Each cord consists of two or more conductors, insulated, apart and covered with an external braid of either cotton or silk, the finished cord having at either end the necessary terminals or connectors.

As many styles of cord are manufactured, the following list of operations on a switchboard cord can be regarded as typical of all cords, the greatest number of operations incidental to the manufacture of any cord being included:

I.—Insulating the tinsel conductor with two lappings of silk.

II.—Impregnating the insulated conductor with a moisture-proof compound.

III.—Braiding the impregnated conductor with soft cotton. One thread of a distinctive color being used as a 'tracer" for identification purposes.

IV.—Twisting two or more conductors together with a filler of twine to render the cord round.

V.—Cutting the twisted conductors to the proper length.

VI.—Unravelling the cord at switch and plug ends.

VII.—Binding the conductors with cotton and wire at switch ends.

VIII.—Binding the conductors with silk, cotton and wire at plug ends, also forming ends of conductors to fit plug.

IX.—Braiding reinforcements of soft and glazed cotton wherever required on cord. External braiding of entire cord.

X.—Soldering connectors on plug and switch ends of cord.

XI.—Waxing cord at plug end. (In wax tank).

XII.—Inspection of finished cord.

Figure VII shows the manner in which the binding and soldering operations are performed on telephone and switchboard cords by girls working at benches. Soldering is accomplished by means of electric soldering irons.

The manufacture of magnet wire is less complex than the processes which we have been describing, as fewer component operations are involved. The incidental operations, however, require the exercise of great skill and care owing to the extreme fineness of the work. Magnet wire is frequently as small as No. 40 B. & S. gauge (.0031 in.), and as its insulation must be spiralled on perfectly even by an insulator running at a very high rate of speed, the operation is necessarily a delicate one. The girl operators, in time, develop a high degree of skill in detecting the presence of skips or knots in the insulation as the wire passes through, and promptly shut off the heads in order to repair the trouble. A skilled magnet wire operator is said to possess "a touch" which signifies that by running her fingers lightly and deftly over the moving wire she can find flaws in insulation which would probably escape her if she depended wholly on sense of sight.

The copper conductor used in the manufacture of magnet wire must have high electrical conductivity and be thoroughly annealed. Only the highest grades of cotton or silk can be used, the Northern Electric Company using for this purpose a soft, even cotton known as "Sea Island" cotton, and a high grade of silk called "Italian Tram." The insulating machine is similar in principle to the five-head telephone insulator shown in Fig. III, with marked differences, however, in details of design and using an entirely different insulating material.

Magnet wire is manufactured in either round, flat or square form and is insulated with either cotton, silk, asbestos or combinations of these materials as required. Before being sent out of the factory on wooden spools, it receives a careful inspection.

Switchboard cables, each containing a number of conductors insulated with servings of silk and cotton, stranded into the form of a core and covered with either an external flame-proof braid or a protective lead sheath, constitute the main feeders in central exchanges. The conductors may be stranded in singles, pairs or threes, the cores being covered by one of three methods outlined in the "Northern Electric Handbook" as follows:

First Method: Dry Core—Layer of paper tape, layer of lead tape, layer of paper tape, an external flame-proof braid.

Second Method: Impregnated Core—Two layers of paper tape, an external flame-proof braid.

Third Method: Dry or Impregnated Core—Two layers of paper tape, a protective lead sheath.

Switchboard wire, as implied by its name, is used for interior wiring in cen-

FIG. 9—GIRLS WINDING INDUCTION COILS, RELAYS, RECEIVER MAGNETS, ETC.

FIG. 10—ELECTRO PLATING BATHS USED IN NICKLE PLATING TELEPHONE APPARATUS.

tral exchanges and is manufactured in the form of single conductors or twisted pairs. The individual conductors are of annealed, tinned copper insulated with servings of silk, covered with an external cotton braid and finally impregnated with a moisture-proof compound. Switchboard wire for use under special conditions, receives a coat of enamel before insulating, this being a recent manufacturing development.

Distributing Frame Wire

The last type of conductor which we will consider is distributing frame, or as it is more commonly known, "Jumper" Wire. This conductor forms the connecting link between the large telephone cables, at the exchange, and the more local switchboard cables, every large exchange having beneath the switchboard floor a complicated arrangement of these interconnections. Distributing frame wire is rubber insulated in a manner similar to rubber covered telephone wire and is afterwards braided and saturated with flame-proof compound.

The Manufacture of Telephone Apparatus

The production of telephone apparatus has already been described as a continuous flow of countless component parts or "piece parts," through a succession of manufacturing operations towards a final assembly, from which latter stage emerges a piece of assembled apparatus containing, perhaps, thousands of the original piece parts. The term piece part, incidentally, is applied to any component which is not complete in itself, but which must be assembled with one or more other piece parts, before it can be catalogued or shipped. When it attains this state it becomes a piece of apparatus. Piece parts are constantly losing their identity, as they journey through a factory, by assembly into larger piece parts or "assemblies," these assemblies being swallowed up in larger assemblies, until the final assembly is made. Samples of telephone apparatus which pass through these stages are: switchboards, power boards, distributing frames, subscriber's set, desk stands, transmitters, receivers, etc. In the manufacture of these and additional forms of telephone apparatus, piece parts numbering into the millions are used.

Each piece part must pass through one or more operations before it is ready for an assembly and each assembly must, in its turn, be machined or otherwise treated until the apparatus stage is finally attained. The telephone apparatus shop of the Northern Electric Co. includes, therefore, completely equipped wood-working, iron-working and mechining departments in addition to those engaged on assembly work.

As it is impossible within the compass of an article to describe all of the manufacturing operations and assemblies incidental to the manufacture of telephone parts, a few outstanding ones of special interest will be dealt with.

Winding Induction Coils, Relays, Etc.

The manufacture of magnet wire has been described under the heading of conductors. This wire, after inspection, is transferred on wooden spools to the winding department, where—by means of small winding machines installed in front of work benches—it is wound in horizontal layers about solid or laminated cores, emerging finally in the form of induction, retardation, relay, receiver magnet or resistance coils, etc.

This operation is performed by girls seated at benches, as shown in Figure IX. While the transfer of the layers of wire, from the wooden spool to the coil, is accomplished by means of the winding machine, the wire is "cross-fed" or guided across the core by hand, and as it is extremely fine in gauge, great skill must be exercised so that convolutions will be regular and layers even. Girls employed on this work, as in the case of magnet wire insulators, develop a "touch" which tells them when all is not well. Under the latter circumstance, the winding machine is stopped and the uneven convolutions of wire unwound by hand, after which the winding operation is resumed. This "touch," which impresses the observer as a sort of sixth sense, is the result of years of practice, during which a degree of skill, bordering on intuition, has been gradually developed.

The Desk Stand and Subscriber's Set

The most widely known form of telephone equipment is probably the familiar "Desk Set," which, to the casual user, consists of a telephone receiver suspended from a hook; the latter projecting out from a vertical metal handle surmounted by an adjustable mouthpiece and supported by a conical metal base with a felt bottom. Equally obvious details are the two flexible cords, one of which passes from the top of the receiver down to a hole in the supporting base, the other passing from the base to a ringer box of polished cabinet wood fastened, usually, to the concealed surface of a desk.

If the subscriber is observant he will note that when he moves the receiver from its hook, the hook undergoes a slight change in position by springing upwards for a distance of about one-eighth of an inch. Nothing more in the external working of his telephone is apparent, and yet, in the space of a few seconds, if he is holding the receiver to his ear, the exchange operator's "number please," comes to him over the line. It is obvious to him that by some mysterious agency he has been connected with the switchboard, but there is nothing to suggest to him in what manner this has been accomplished. So he usually "lets it go at that."

Assembled into the upright handle, (which is a length of hollow brass tubing, with its outer surface either japanned or nickel-plated), is a terminal strip of galvanized steel, to which one end of each flexible cord is connected. Fastened to the side of this terminal strip, are three smaller nickel-silver strips,

FIG. 11—RECEPTION ROOM AT MAIN ENTRANCE TO THE GENERAL OFFICES.

FIG. 12—EMPLOYEES CAFETERIA DURING LUNCH HOUR.

insulated apart and having on their adjacent sides, platinum contact points. One of these strips is longer than the other two and is sprung against the inner or concealed part of the receiver hook. The weight of the receiver hanging on the hook is sufficient to hold this spring in such a manner that the contact points are kept apart. When this weight is removed, however, the points spring together, and a connection is established with the switchboard. That, in brief, is what happens every time the receiver is lifted from the hook.

Surmounting the handle, is the transmitter box containing the transmitter diaphragm—a thin disc of aluminum japanned on its outer side—and the carbon "button" assembly, which is connected with the terminal strip by means of a conductor running down through the interior of the handle. The carbon button and transmitter diaphragm are held in position by means of a galvanized iron bridge, which serves as a mounting for the transmitter assembly. The hard rubber mouthpiece with its perforated rubber back can be included as the final detail in this assembly.

The receiver assembly is simpler than that of the transmitter, and consists of a hollow rubber shell, into which is placed the receiver magnet. At one end of this magnet is the receiver diaphragm, protected by a hard rubber cap, while mounted at the opposite end is the concealed binding post, to which the flexible cord is fastened.

The ringer box or "subscriber's set" forms the last detail in this desk equipment. The ringer box is of polished cabinet wood, surmounted by two nickel-plated bells and contains an induction coil, a condenser and ringer coils.

The Multiple Switchboard

The largest, most imposing and most complicated piece of telephone apparatus is undoubtedly the multiple switchboard. Kempter B. Miller, in his "American Telephone Practice," refers to it as "That wonderful complex whole—the modern multiple switchboard," and when it is considered that any of the exchange operators can, without moving from her chair, connect up any calling subscriber who is connected to that exchange, some idea will be gained of the scope of a single section of one of these boards.

A multiple switchboard is built in sections, somewhat in the manner of a sectional bookcase. These sections are erected beside each other in the central office, expansion up to the limit of available floor space being thus provided for. The multiple characteristic is obtained by having all the subscriber's lines multiplied through all the sections, each operator being thus enabled to plug into the line of any subscriber.

The "Jacks" or switchboard terminals are mounted in strips, these held parallel in a hard rubber mounting by means of brass binders, known as "binding strips." Each exchange operator has on the vertical panels in front of her, horizontal rows of sockets belonging to three divisions of these jacks. The upper division comprises subscriber's multiple jacks, those in the middle division are trunk jacks connecting with other exchanges, while the lower division is devoted to subscriber's answering jacks. Figure VIII, showing a large multiple board in a central exchange, will make clear the jack arrangement, as well as the sectional construction of the board.

The manufacture of the component parts of a switchboard and also a part of its assembly is performed at the factory prior to shipment. Most of the assembly, however, is done at the exchange before erection, after which the connections with the underground cables are made through the main distributing frame.

Details in switchboard construction include the forged iron frame, screwed together in jointed sections—the keyboard with its horizontal row of assembled listening and ringing keys—the maze of rear connections and electrical apparatus including relays, induction coils, retardation coils, terminal strips and local switchboard wires; the assembled jack-strips and switchboard cable; the exterior wood work of polished cabinet wood; and the flexible cords with their plug terminals.

A necessary adjunct to the switchboard is the "Distributing Frame," which, as in the case of the switchboard frame, is fashioned from forged iron and assembled into standard sections. These sections are shipped to the various exchanges and are erected usually on a floor below the operating room. The distributing frame through the medium of "jumper" wires, serves to distribute the outside lines to their proper switchboard connections. The distributing frame wires may be cross-connected at will, this enabling a subscriber to change his residence in the same district and yet retain his original phone number.

Electroplating and Japanning

It is necessary that the outer surfaces of many telephone parts be protected against corrosion, and also that the appearance of certain parts be enhanced by a special finish. This is accomplished by nickel-plating, electro-galvanizing, or japanning the parts in question. If a nickel-plated surface is wanted, the piece parts are hung on brass racks; a row of these racks being then suspended into a plating tank containing a nickel salt solution. Opposite this row of racks are hung a row of pure nickel bars, which serve as anodes or positive poles, the racks of telephone parts providing cathodes or negative poles. Current supplied from a special generator causes the disassociation of the pure nickel anodes, the particles of which, carried through the solution by ionization, plate out at the cathodes, causing a deposition of nickel on the telephone parts. After an immersion of about forty minutes, the racks are removed from the plating baths, the plated parts then being detached from their hooks and transferred to a buffing department where they are polished on buffing wheels. Nickel-plated parts of desk sets, etc., are treated in this way.

Piece parts intended for service where protection from corrosion, rather than appearance, is desired, are electro-galvanized or zinc-plated. This is accomplished in the manner just described, excepting that the anodes are pure zinc bars, the electrolyte solution consists of a zinc salt, and the parts receive in this instance an immersion of twenty minutes.

The familiar black finish seen on the handle and base of the desk stand is obtained by spraying on a coating of japan with an atomizer. This coating is then baked to hardness in an oven.

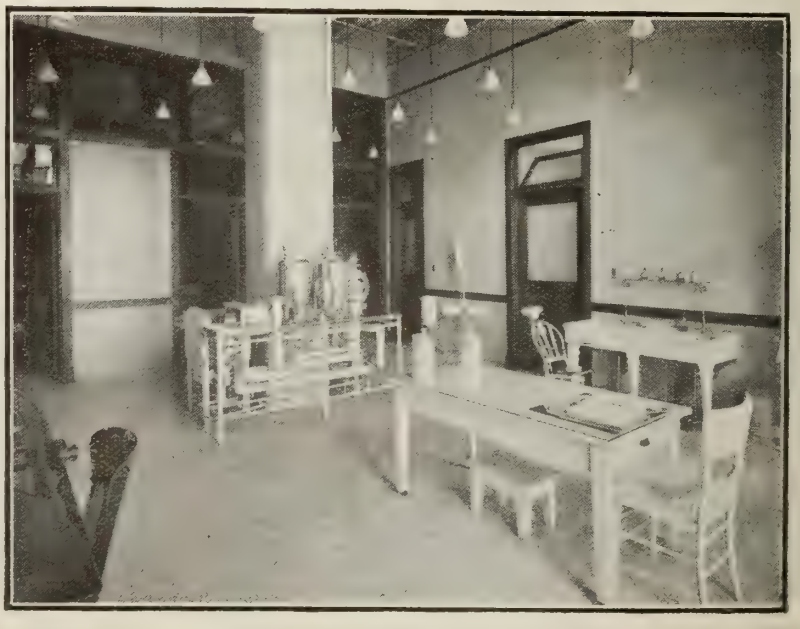

FIG. 13—RED CROSS AND MEDICAL EXAMINATION

Figure X shows the Northern Electric electro-plating department. The tanks in the foreground, containing an acid solution, into which the various parts are dipped before immersion in the plating tanks; this dip serving to remove all foreign matter and provide a smooth plating surface. The operators are shown holding up the brass racks of attached telephone parts.

The General Manufacturing Organization

In the foregoing description, manufacturing operations have been dealt with from the standpoint of their actual performance in the factory. There are other phases of manufacture, however, which bear more indirectly, but with equal importance on the success of the final result. An adequate labor supply, for instance, must be secured, trained, maintained and compensated. Store rooms must be stocked with raw materials and supplies, and these in turn must be issued to the proper shop departments when needed. Each of the multitude of piece parts, which are passing constantly from operation to operation, must be at its proper place, at the proper time and in the proper way. The manufacturing cost of labor, raw material, machinery, tools and supplies must be carefully ascertained and kept, to serve as a barometric record on the economy of manufacture. A raw material, process and final inspection, including physical, chemical and electrical testing, must be conducted in order that a uniformly high standard of quality in the product shall be maintained. A power supply must be generated and distributed. Mechanical equipment must be kept in a state of repair and newer and better equipment must be designed and built, or purchased. Manufacturing methods must be subject to constant development and standardization. Time and motion studies, a necessary preliminary to the setting of piece work and bonus rates, must be conducted. Sanitary and attractive working conditions for factory and office employees, must be provided and maintained. To sum up the whole matter in a single word, all the stages and conditions in and surrounding manufacture must be planned and planned in advance. The operating branch, concerned with the actual performance of the manufacturing operations, is supplemented, therefore, by the following additional branches which attend to the more indirect details of manufacture:

(a) A production branch.
(b) A clerical branch.
(c) An inspection branch.
(d) A plant service and maintenance branch.
(e) A technical branch.
(f) An industrial relations branch.
(g) An installation branch.

These branches are subdivided into, and function through divisions and departments.

In order that the collective efforts of branches, divisions and departments shall attain their greatest impulse, an atmosphere of sympathetic and unselfish co-operation must circulate so thoroughly throughout, that no individual will escape its influence. The importance of this principle as a dominant characteristic in industry is being widely recognized to-day, and the sociological problems incidental to manufacture are receiving greater attention than ever. And they will receive even greater attention to-morrow. Walt Whitman's famous statement that, "Whoever walks a furlong without sympathy, walks to his own funeral dressed in his shroud," applies to life generally, and a great factory, with its assembled human medley, is just a manifestation of life.

Hexagon Making Scheme

By LEONARD SNARY

Thinking that you might be interested in the method which I used in drawing the hexagonal prism (as it appears to the eye), I will endeavor to explain the details, aided by an illustrative drawing This, so far as I know, is original.

After trying several different ways, I discovered the following, which serves the purpose.

Figure 1 is the mechanical drawing of the prism from which we make the "eye view drawing."

Construct a parallelogram E, G, F, H, using the face dimension of hexagon A B, which is 9/16 in., for the length E H. The altitude of the parallellogram may be any suitable dimension, but in this case is 5/16 in. The angle K L may also be any angle best fitted for the purpose, the one chosen here being 60 degrees. Find centre of the parallelogram by drawing lines from E to F and G to H. The distance between points C and D (Fig. 1) is 1 1/8 in. From the centre of parallelogram point o: 9/16 in. on each side horizontally. This gives points I and J, which are the same as points C and D, Fig. 1. Next joint points I, G, F, J, H, E, thus completing the top end of the prism, with the desired slope.

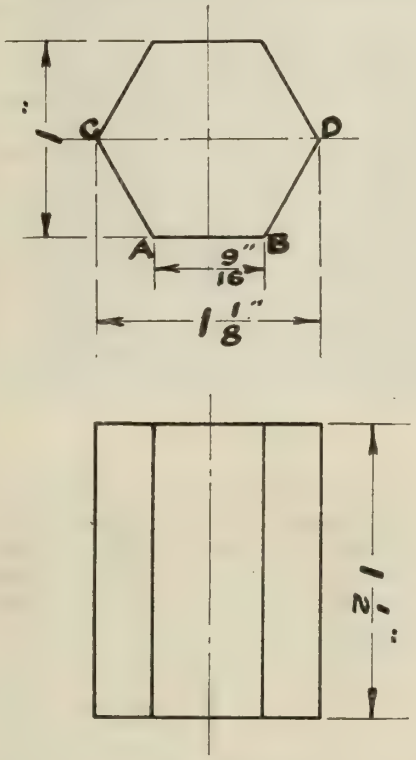

FIG. 1

To finish the drawing, carry down the necessary points to the desired depth, which is 1½ in., and the result will be a part top and a part side view of a hexagon prism.

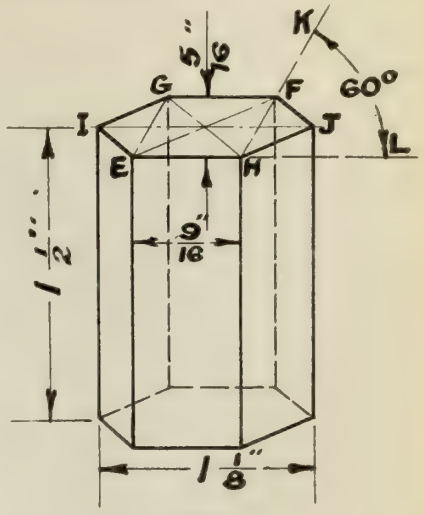

FIG. 2

Make haste slowly when opening an oxygen cylinder valve. There are two reasons why. In the first place, it is injurious to the high-pressure gauge to admit a pressure of 1,800 pounds into the Bourdon tube suddenly. The impact may burst the tube and ruin the gauge. In the second place the sudden compression of the air or gas in the regulator passage is accompanied by heat. The heat may be sufficient under certain conditions to destroy the regulator seat, thus letting the high-pressure oxygen into the diaphragm chamber and bursting the regulator.

A platinum substitute lately tested, according to the "Chemical Trades Journal," in Amsterdam, was an alloy of 89 per cent. of gold with 11 per cent. of platinum. This material, called "platino," withstood sulphuric, hydrochloric and nitric acids, and other reagents used in chemical work, and was unaffected by heating for half-an-hour in a smoky petroleum-gas flame. It proved equal or superior to platinum in ware for the chemist's laboratory, except for the large loss by corrosion when used in contact with a mixture of sulphuric and nitric acids.

Two French scientists have found that X-ray screens made of a compound of tungsten and cadmium give better results than platinum ones at far less cost.

The Booth Rotating Brass Furnace

A Type of Electric Brass Furnace in Which the Shell is Rotated. This Results in Less Zinc Loss Through Vaporization and a Longer Furnace Life.

By Carl H. Booth
Pres. Booth Hall Co., Chicago

ABOUT five years ago we were associated in the design of several electric furnaces for the production of special chemical compounds. These furnaces were cylindrical in shape and arranged to rotate about a central axis through which the electrodes projected. At the time it was suggested that this type of furnace could be adapted to the melting of non-ferrous metals, but there was no opportunity to carry on such work. An illustration of one of these furnaces is shown in Figure 1.

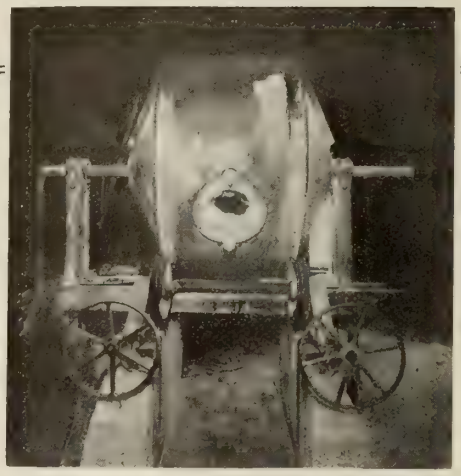

FIG. 1—ORIGINAL ROTATING FURNACE.

In these earlier furnaces a door was provided in the cylindrical surface of the shell and lining, for charging and pouring, but we experienced considerable difficulty in maintaining the lining around this combination spout and door. Further, in pouring the furnace it was troublesome and inconvenient to be obliged to place the ladle between the supports beneath the furnace. Consequently, in designing the present Booth Furnace, these difficulties have been overcome by placing the door in one end of the furnace, as shown in Figures 2, 3 and 4, and having a tapping hole in the other end, as shown in Figures 2 and 3. In this way the cylindrical surface of the lining and shell is unbroken by any opening. This permits the continuous rotation of the furnace, and consequently the absorption of heat by the charge from all parts of the lining, which means no local overheating and uniform wear.

Capacities

As a general rule, the quantity of non-ferrous metal melted at one time, or at one heat, is less than the quantities involved in the melting of steel and iron, and, therefore, smaller sizes of furnaces are desirable.

To meet the requirements of the small foundry, as well as the large foundry, and the smelters and refiners, Booth Furnaces are built in the following sizes:

Rater Holding Capacity	Maximum Holding Capacity
250 lbs.	350 lbs.
500 "	750 "
1,000 "	1,500 "
2,000 "	2,500 "
3,000 "	4,000 "

There are many small plants where heats of 50 to 350 lbs. are required, and the smallest size furnace shown above answers the purpose with great economy, whereas larger furnaces to operate efficiently must produce more metal than is needed. Further, there is also a great disadvantage in trying to pour a ton of brass into small castings and keep the metal hot. We know of a large company having a one-ton electric furnace where it is taking them 50 minutes to pour a heat into castings, and they are finding great difficulty in doing so. Further, the great variety of mixtures made by many small foundries requires a small, efficient unit, from which "short" heats can be taken, producing great flexibility of operation. On the other hand, smelters and refiners frequently require furnaces of relatively large holding capacity, which will turn out a considerable amount of metal per day.

Any one of the above furnaces will melt and bring to pouring temperature a charge of its rated holding capacity in an hour's time, when the furnace is hot.

Mechanical Details

The illustrations and drawings give a very good idea of the general design of the Booth Electric Furnace.

Figure 2 is a cross-section or diagram, illustrating clearly the principle of construction. As will be noted the furnace rotates on rollers, and is carried by two cylindrical tracks. The rollers are driven at the proper speed by a motor, so as to rotate the shell at a speed of two revolutions per minute. No gearing is required encircling the furnace. The current is carried to the electrodes by means of short pieces of flexible cable, which connect to the above-mentioned track, and the current is supplied to the track by means of shoes which press against them and form a sliding contact. The electrodes are regulated by means of screws shown, and on small furnaces are entirely hand-operated, but on the larger furnaces automatic electrode control is used, thus doing away with the necessity of close watching on the part of the operator.

In the small furnaces, the door is in one end only, but in the larger furnaces both ends are provided with a door.

Figure 3 is a photograph of a rear view of a 250-lb. Booth Electric Brass Furnace, in the foundry of Leitelt Brothers, Chicago. This shows the charging door open ready for charging. The latch which holds the door shut when the furnace is charged will be noted and also the electrode projecting through the door. A door of similar type with electrode projecting through it has been in use for a considerable period in the construction of the Booth-Hall steel melting furnace, built by our company. The contact shoes are shown in this view pressing against the track.

Figure 4 shows the same end of the furnace after it is charged and the furnace is ready to run. The flexible cables from the track to the electrode holder are shown, as are also the water-cooling connections for cooling the electrodes. It is not necessary to open the door until after the heat is poured. The door is then opened for charging.

Figure 5 shows a front view of the 250-lb. Booth Electric Brass Furnace, and illustrates well the cylindrical drum type shell and the track driven by the rollers. This also shows the bronze

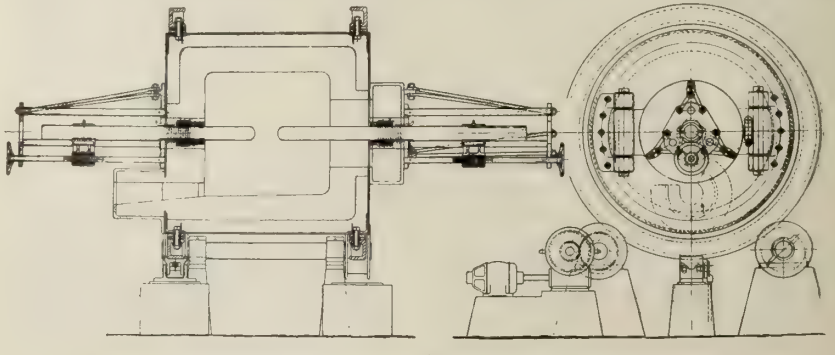

FIG. 2—CROSS SECTION AND END ELEVATION OF FURNACE.

shoes which carry the current to the track and the flexible cable connected with the electrode holder and the water connections. The pouring tap is shown directly beneath the electrode holder frame.

Figure 6 shows a side view of the furnace. The cable supplying the power to the furnace is shown on both sides, coming from conduits in the floor to the bronze shoes. These are the only connections necessary to carry the electricity to and from the furnace. The contractors are shown on the switchboard, together with push-button control for starting and stopping the furnace.

In pouring the ease with which the men handle the ladle up to the furnace, and the operator controls the furnace at the switchboard by means of push-button control, add greatly to economy in operation and to the comfort of the crew.

Lining

Probably the most important of all factors in reliable and efficient furnace operation is the lining. Especially is this true with the melting of non-ferrous metals, where a lining with many joints will have a decided tendency to absorb metal. In order to overcome this difficulty the lining provided with the Booth Furnace is made with as few joints as possible.

In lining the furnace the electrode supporting mechanism at either end of the shell is removed by simply unbolting same from the end plates. These are made as a unit and in taking them off they do not get out of adjustment or out of line, and therefore do not require any adjusting when put back in place. The shell is then lifted off the rollers by suitable hoist or crane, just as if it were a barrel and is turned on end so that the end plate of the furnace shown in Figure 3 can be unbolted and removed from the shell.

Figure 3 shows to some extent how this lining is made. The door is made of one solid piece of brick with a hole in the centre through which the electrode projects. The cylindrical part of the furnace is made of two cylindrical tiles, which fit together with a tongue and groove joint in the centre, this joint being filled with heat-resisting cement. The ends of the furnace are each lined up with four special bricks, joined together with cement and cemented to the tile. In this way we really have a large crucible electrically heated, but with walls of considerable thickness, and a minimum number of joints. Further, this lining does not require a brick mason to instal it, but can be put in with common labor. This special brick lining is backed up with a layer of heat-insulating material, so that when the furnace is at working temperature, the temperature on the outside of the shell is so that the hand can be placed upon it. Compare this with the large amount of heat in the neighborhood of a crucible or other fuel fired furnace, and it will show you how much easier it is to get men to work around a furnace of this character.

The time required for relining this furnace is 8 to 12 hours.

Charging

In starting the furnace the tap hole is plugged with moulding sand, the charge placed in the furnace, the door closed and the power thrown on. The electrodes are then brought together by means of the moving mechanism shown in the photograph and the amount of current flowing regulated by moving the electrodes closer together or further apart, as indicated by the meter on the switchboard.

Methods

If turnings, floor sweepings or grindings are used the rotation of the furnace is started at once and continues until the metal is ready to pour. We have never broken an electrode in operating in this manner. If ingots or heavy scrap is used, the furnace remains stationary until the ingot is partly melted, and then rotation is started and continued until the metal is ready to pour. We have experienced no difficulty in regard to breaking electrodes when this method is followed.

As the furnace is sealed up quite tightly from the time the power is on until ready to pour, we have obtained very good results as to metal temperature by keeping the power practically constant for a definite length of time. After the operator has poured a few heats, it is possible for him to determine the right temperature practically every time without opening the door and inspecting the metal in the furnace.

Pouring

In pouring the furnace, the pipe stands which carry the water connection simply lift out of the way without it being necessary to unbolt anything, and the men can go right up to the furnace with the ladle.

When the furnace is ready to tap the operator stops the rotation until the tap hole is above the level of the holder, and thus above the surface of the metal. The tap hole is then opened by means of a sharp-pointed steel rod. As the tap hole is simply plugged with moulding sand there is no sledging or pounding required, as we have found it can be very readily picked out if a small pointed rod is used. We have never had any trouble with the tap hole. After the tap hole is opened, the furnace is rotated down until the opening is below the surface of the metal, and the metal poured out into the ladle as illustrated. If it is desired to only remove a portion of the metal, the furnace is again rotated back and the tap hole brought above the level of the metal in the furnace.

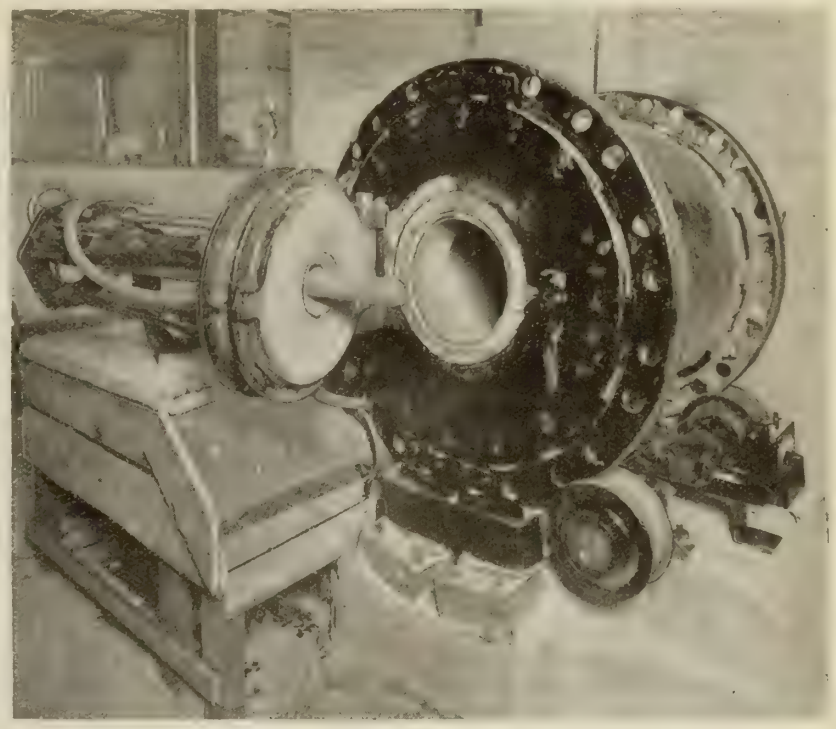

FIG. 3—SHOWING METHOD OF CHARGING FURNACE.

On account of the fact that there are no swinging cables connected with the electrode holders, it has been suggested that the furnace itself could be picked up from its rollers by means of a crane and the metal poured into ingots or castings. We have not attempted to do this as yet, but it seems to be entirely feasible.

Operating Records

With the small furnace which is in the plant of the Leitelt Bros., Chicago, we have poured about 130 heats, using a great variety of mixtures and pouring a considerable number of different grades of metal. We have used:

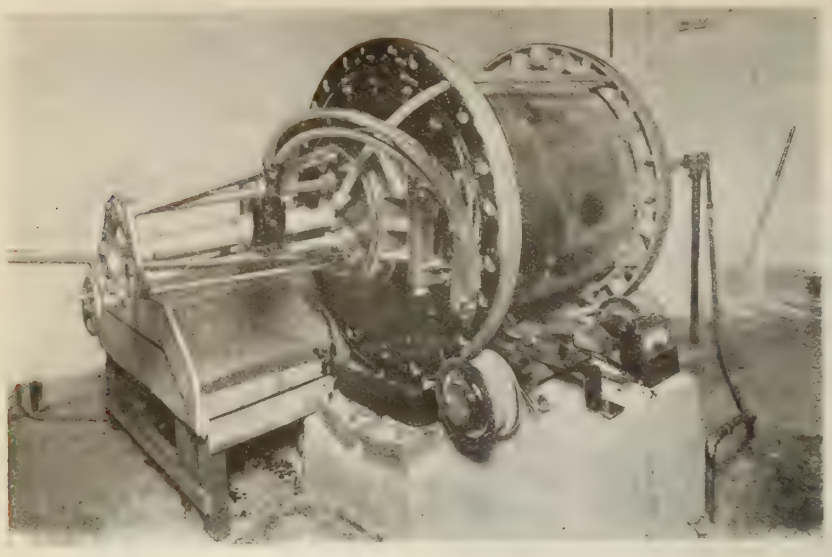

FIG. 4—ARRANGEMENT OF ELECTRODE GEAR.

Yellow brass turnings and borings; concentrates from floor sweepings; grindings; foundry scrap; copper wire; sheet copper; red brass ingots; yellow brass ingots; copper ingots; pig tin; lead pipe; pig zinc; German silver.

So that the furnace has been thoroughly tested on many classes of material.

Power Consumption and Shrinkage

In melting down turnings, borings and grindings with a hot furnace, 30 to 40 minutes is required per charge. With the small furnace shown a power consumption as low as 240 kw. h. per ton has ben obtained. The average would be between that and 300 kw. h. per ton.

With yellow brass turnings and borings which are fairly clean, but on which no attempt has been made to remove any contaminating material, heats have been run with a total shrink of 1½ per cent. These borings, when charged, were in the same condition as received from the seller. Of course the percentage of shrink will depend on the amount of oil, dirt, iron and other extraneous material present, but the actual metal loss has proven to be very low. Due to the active mixing action of the rotation, the heat is applied to the turnings and borings in such a uniform manner that there is no local overheating, and a quick melt with low metal loss is obtained.

In melting concentrates from floor sweepings, which contain a considerable amount of dirt and moisture, and which when melted in crucibles showed a shrinkage of 30 to 40 per cent., the Booth Electric Furnace over quite a number of heats averaged 17½ per cent. shrinkage.

In melting ingots and heavier brass scrap, a heat will average from 30 minutes to an hour in length of time, depending upon the kind of metal poured and the size of the charges. A 300-lb. charge of copper ingots requires about an hour to melt and pour, while a 300-lb. charge of yellow brass about 40 minutes. The shrinkage with yellow brass ingots averages about 1 per cent. and on red brass and high copper bronze under 1 per cent. With the furnace hot the power consumption will run from 250 to 350 kw. h. per ton.

One heat was made with a charge running about 50 per cent. zinc and 40 per cent. copper, totalling 250 lbs. 249 lbs. of metal were poured and the power consumption was 240 kw. h. per ton. This was in the latter part of the day when the furnace was hot, and the metal charged was all clean metal. The ladle was weighed as it was brought to the furnace, and then weighed after the metal had been poured into the ladle. Great care was taken on the part of the operators not to overheat the metal, and this is simply an indication of what results are accomplished where sufficient attention is given to melting. The heat following was a charge of 225 lbs. of red brass ingots, from which 224½ lbs. of metal was poured.

It is particularly difficult to keep account of the metallic shrinkage in a small furnace of 250 lbs. holding capacity, and consequently great care has been exercised. Arrangements were therefore made for a scale near the furnace, upon which the heated ladle was weighed when brought to the furnace and again weighed when filled with metal. Any drippings from the furnace were carefully collected and weighed and any slag coming out with the metal was skimmed from the pot before weighing, as even a small amount of one pound would mean almost one-half of one per cent. shrink. With a larger furnace, it would be much easier to make shrinkage tests without danger of as large a proportionate loss as with the smaller furnace. In other words, if one pound of metal poured did escape being weighed, it would not represent as much shrinkage as in the case of a small furnace.

Lining Wear

To date about 130 heats have been run and the lining on the furnace illustrated shows no perceptible wear. The lining is sintered upon its surface and appears to be in as good condition as when originally installed. This is the first lining installed in the furnace. The material of which the lining is made is such that it does not shrink, spall or crack, although the furnace is run on an average of 8 hours per day. Based on a great many years' actual experience in the operation of electric furnaces of many types, our engineers feel confident that linings of this type will last from 600 to 1,000 heats, and possibly longer, with proper care on the part of the operator.

Another important characteristic of this method of lining is due to the fact that there are practically no joints, which serves to keep the lining clean and prevents any considerable amount of slag or metal sticking to it.

Electrode Consumption

With furnaces of this type the graphite electrode is to be preferred, due to its greater conductivity, which permits the use of the smallest size of electrode practical for the current to be carried. On this furnace electrodes of 2½ inches diameter are used, machined and equipped with what is known as nipple joint. These are 30 inches in length. The electrodes enter the furnace through graphite sleeves. This opening is also protected by a water-cooling copper casting

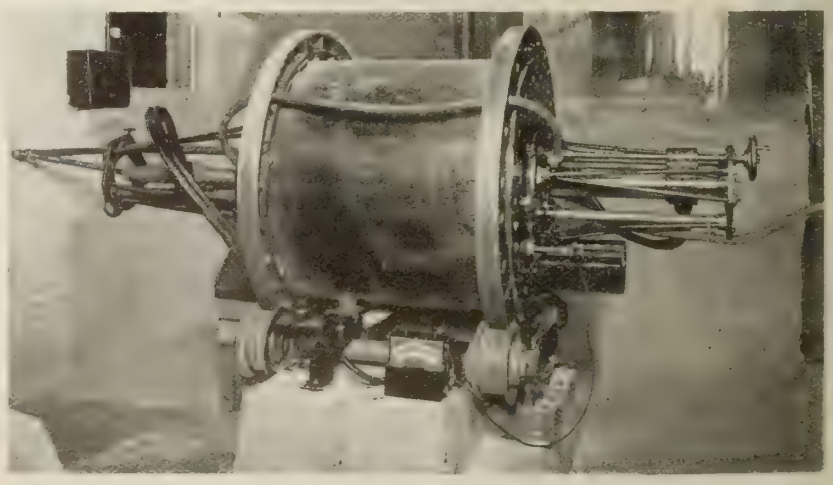

FIG. 5—GENERAL SIDE VIEW OF FURNACE.

which serves to protect the electrodes from burning at this point.

Even with the small 250-lb. furnace shown, the electrode consumption is low. If the furnace is kept in operation fairly continuously during an 8-hour day, the consumption will average about 3 lbs. per ton.

The electrode supporting mechanism has been so designed that it not only permits of adjustment in case electrodes are slightly out of line, but at the same time serves to protect the electrodes from breakage, due to the accidental falling of bars or other material against the end of the furnace.

Power Factor

A great deal of difference of opinion still exists among operating engineers as to the proper power factor best to be used in connection with electric furnace loads. With small furnaces of the type just described, our judgment is that as low a power factor should be adopted as can safely be permitted with the conditions met with at the point of installation. This can be varied to suit different conditions by modifications in the design of the equipment. If a power factor as low as 70 per cent. is permitted, the result will be that the furnace operator need not stay at the electrode hand wheel control to any great extent, but may be employed in getting his charge ready for the next heat, making suitable records and other miscellaneous duties. If, however, a higher power factor is required, the furnace can be readily operated, but will require more attention on the part of the operator unless automatic electrode regulators are provided.

It is our judgment that in case of installation of a battery of small furnaces, providing a sufficient advantage in power rate could be obtained by obtaining a higher power factor than 70 per cent., it would be best to instal automatic electrode regulators. There would also be compensation in reduced labor cost due to the fact that one man could take care of a large number of furnaces under such conditions.

Labor

On small furnaces of the size described, one furnace operator can conveniently handle three furnaces without the use of automatic electrode control. This would of course not include the miscellaneous labor for charging and making up the heats, but one extra man could easily take care of this.

With the 250-lb. furnace described by this paper, we can easily charge, melt and pour a ton of metal in 7½ to 8 hours. This same rate of speed is maintained for all sizes of Booth Electric Brass Furnaces. With the larger sizes, it will of course take a little longer time to charge and pour, but proper mechanical means can be provided for charging so as to reduce the time to a minimum. If the furnace is used entirely for melting turnings and borings and other small scrap the daily output will be slightly increased.

Advantages

1. In designing the Booth Electric Rotating Brass Furnace it has been the aim of the designers to produce a furnace which was efficient enough so that it could be built in small sizes suitable for adaption by the small brass foundry; at the same time such a furnace must be strong and rugged in construction, have few parts and be simple electrically, not requiring the supervision of an electrical engineer or other expert.

2. At the same time furnaces of this type can be built in large sizes and offer as many advantages to those plants requiring a large tonnage of brass, as is true with a small foundry.

3. The charging door of the furnace is located at the opposite point from the tapping. If a battery of furnaces is installed in a plant, it is a great deal more convenient, and economical both in the labor cost and in the handling of materials to have the charging operations carried on at one end of the furnace, entirely separate from the tapping and pouring. This also saves in floor space as the furnaces can be located very close together under such an arrangement.

FIG. 6—SHOWING SWITCHBOARD AND MOTOR FOR ROTATING.

4. In pouring the furnace the tap hole is opened without coming in contact with the metal, and as the furnace is rotated by the motor the metal pours out and can either be collected in ladles or could be poured directly into moulds or ingots brought up to the furnace by approved mechanical means. It is also entirely practicable to pick the furnace up off its rollers and carry it by means of suitable electric travelling crane over to the moulds and pour directly into the moulds. This method would be especially well adapted for pouring ingot moulds or the casting of slabs. After the furnace was poured it would then be returned and set on the rollers, charged and started in operation. Since there are no cables to be disconnected or other electrical connections made, this can be readily done.

5. The absence of overhanging cables and the simplicity of the electrical connections is one of the great advantages of the Booth Electric Furnace. This is readily apparent and is referred to again simply for emphasis.

6. Where a large number of Booth Furnaces are installed in one plant, we recommend the purchase of an extra furnace shell, which could be kept lined up ready for service. This will be particularly valuable in the case of plant operating on 24-hour basis, as it would save time in shut-downs. The method proposed would be: as soon as the lining of one of the furnaces in use was worn out, the furnace needing a new lining would be lifted off its rollers and the spare furnace set in place, immediately charged and started up without losing more than half an hour's time altogether. The furnace shell which was removed could then be allowed to cool down and new lining placed in it ready for further use.

7. The important reason why electric furnaces are being adopted by plants melting brass is because of the large saving made in metallic shrinkage. The construction of Booth Electric Furnace is especially noteworthy in this respect, and all advantages due to the movement of the metal are secured by the rotation of the furnace.

8. Where mixtures are used which might result in the formation of much gas pressure in the furnace, the charging door or doors need not be luted up so as to permit of the escape of the gas pressure without blowing out the end of the furnace, as we understand has been the case in a number of instances where sufficient openings have not been allowed. This can also be accomplished in a very simple manner by leaving the tap hole open for a short time in case it is desired to burn off the oil and dirt prior to the melting of the charge. In other words, with a charge of turnings and boring which are dirty and oily, the furnace can be left in a stationary position with the tap hole open. The furnace being turned around on its rollers so that the tap is located at the top position instead of at the bottom, which would be the position in pouring. This open tap permits the burning oil and fumes to escape. As soon as the operator notes that metallic vapors are coming off, the tap can be plugged up with moulding sand and the rotation of the furnace started.

9. The complete rotation of the Booth Electric Furnace results in more even wear of the lining, a greater absorption of heat by the metal from the same, which naturally results in an improved power consumption. These factors help

Canadian Machinery Drafting Course—Part XI

Continued From January 15th Issue. We Caution Students Against Some Common Pitfalls, Pointing These Out on the Plate. The Building Up of This Vise Should be Watched With Interest

By J. H. MOORE, Associate Editor Canadian Machinery

WE left off at the term, finish all over in the last section, so now let us go on to the subject of proper dimensioning. To say what plan to follow out is difficult, for every drawing office follows out the instructions of its chief, but for the purpose of this course we will decide to keep everything in inches. A practice often adopted is to call anything over 24 inches by the term, feet and inches, but as stated before we shall stick to the term inches only.

When micrometer or gauge measurements are required, all dimensions should be given to at least three decimal places. In some cases, closer dimensions would be essential, but for the average case three will be found to be sufficient, as that allows the working to one thousandth of an inch. Be careful where you place your decimal point.

For example, take 6·346. This method of placing the point near the top is not good practice. It should be written thus, 6.346. Note that the point is directly at the bottom and not near the top. In a case where the dimension is less than one inch, a zero should always be placed ahead of the decimal point. This avoids all confusion and makes for safety. We will suppose the dimension to be .346 in. We will further suppose that in tracing this point was rather weakly inked in, and did not show in the blue print. To further complicate matters, a speck of dirt got in between the 3 and the 4, with the result that the dimension showed up as 3.46. This may sound like a fairy tale, but the writer has found this condition to happen at the most unexpected time. Had the dimension read 0.346 it would have made things much easier. True, one might say—well, why not take it for .0346, still the possibility in such a case for error is not so great. When possible, all dimensions should be given so as to read from the bottom right side of the drawing.

Start dimensions from a finished surface or a predetermined centre line wherever possible.

Last but not least, watch your arrowheads and dimension lines. Never make dimension lines as heavy as the others, and be sure to carry them out to the proper point. Never let an arrowhead stop before it touches its dimension line, nor never let an arrowhead go over the line. Above all, make sure you put them in. This may sound like useless preaching, but it is an easy job to miss out arrowheads and dimension lines, easier in fact than one would imagine.

On plate No. 11 which we reproduce in this section, we have purposely made mistakes in order to point out the common pitfalls encountered by the tyro. We do this in order that he will not do likewise, but avoid them by having them pointed out so plainly.

We announced in section 10 of the course that we had secured various portions of a well-known miller for use. and readers can, no doubt, appreciate the value of such practical plates to work from.

It is not often that in a course of this nature actual design is allowed to be shown, but time goes on, and as this course advances readers will see how valuable the saving of each issue will be to them.

To commence with, we have taken the type of milling vise illustrated at Fig. 1. To those engaged in the machine shop industry, its appearance will be familiar, but to others not so engaged a careful study will be worth while.

In this plate we will consider the small details, the next the base, in the next the swivel base, and in the final plate, the assembling of all the parts. For this reason we would advise students to carefully follow out all instructions. First, we must change the dimensions of our plate on this occasion. Make it 16 in. x 16 in. to border lines, and leave ½ in. space all around. This leaves the paper actually 17 in. x 17 in.

Starting at Fig. 1, we notice the jaw of the vise. This piece should be easy for the student to lay out, so no comment or help is offered in this regard. We will, however, call attention to four points in connection with the drawing. Note the C's'k to illustrate countersink. Some offices practise this abbrevation, but personally, we believe it to be too short. Attention is called to the fact that only one arrow head and line reaches this notation, while it would be good policy to place another line leading to the other hole.

Next, three views are shown where two is all that is necessary to fully illustrate the nature of the piece shown on the end view (providing this view had been necessary), there is dotted outline of countersink screw hole. This is still another omission. Students will notice the f.a.o. sign. This is a very brief method of stating finish all over. Lastly, look at the underline which reads jaw wanted steel. This is poor policy to merely state steel. There are numerous grades of steel ranging from ordinary carbon steel to the high speed variety. Always state, if possible, the grade of steel desired.

Let us go on to Fig 2. Again we give the reader no help in the layout of this part, it being so simple. Note the only two views are shown, this being sufficient. On one of the holes in the plan view we have marked 17/32 in. but left out an arrowhead. On the other hole we have omitted the dimension entirely! While a workman would take it for granted that both holes were of similar size, still this is not good policy. A better plan would be to make a notation, as shown at Fig. 1 between the two holes and run lines and arrowheads to each hole. On view No. 2 is also illustrated a better method of showing the term finish all over.

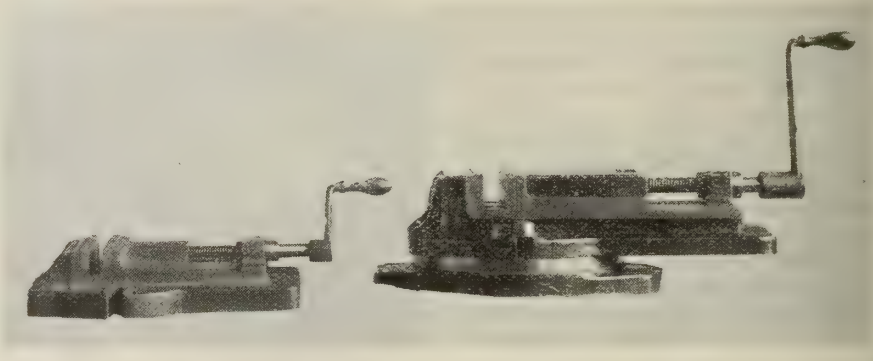

FIG. 1—SHOWING THE VISE, WITH AND WITHOUT THE SWIVEL BASE.

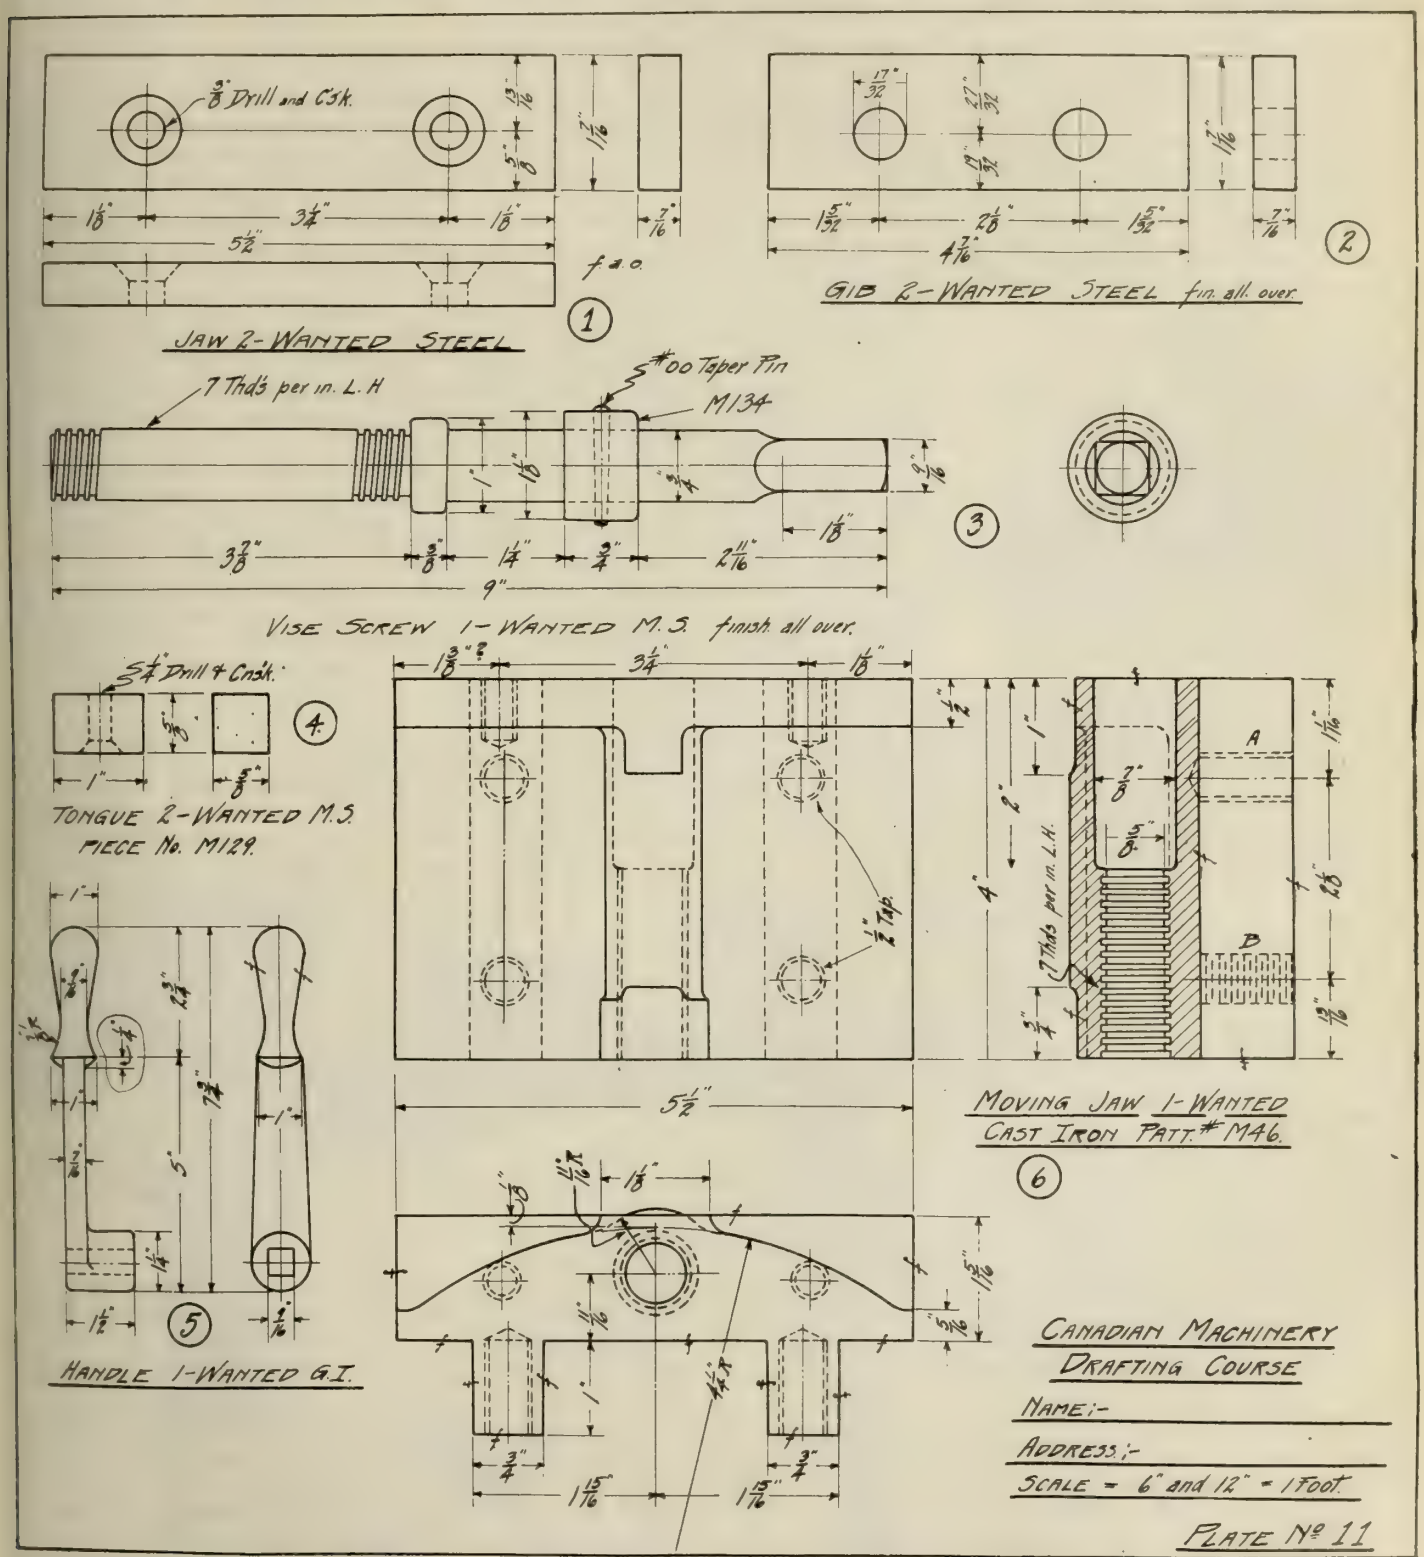
In the layout of piece No. 3, it is good policy in a view of this nature to draw your centre line first. Students will note the convenient system of showing a square thread. While this method is not absolutely correct it is permissible, and is used in a great number of drawing offices. Its chief advantage is speed, with ease of understanding what is wanted.

In stating the number of threads per inch, we have omitted to mention square thread. Be very careful on this point, for there are so many various standards of threads, the U. S. system, the V syster, and so on.



Next, the dimension of the diameter of the thread is left off. While, no doubt, one could look at another portion of the view and see the 3/4 in. dimen-

sion, still it is a risky proposition to take it for granted that this dimension is what it was intended. To those reading drawings, we can only say, never take anything for granted—find out to be sure. Better be sure than sorry.

Let us now refer to the note calling for a No. 00 taper pin. In some cases, this note would be considered O.K. by firms who believe in leaving the question of length to the machinist, but in the majority of cases not only is the size of the pin given, but also the length. The latter policy is much the best, for it leaves nothing to be conjectured about, but issues definite instructions. For example in the case illustrated the note should have read No. 00 taper pin 1¼ in. long.

Another point to be watched is the method we have employed in dimensioning the square end portion of this screw. We have carelessly marked 9/16 in. leaving it to the common sense of the machinist to see from the end view that the piece is square. Suppose there was no end view shown, what guarantee would he have that it was not 9/16 in. diameter, or even 9/16 x 3/4 in.? To overcome this danger, we can adopt two styles of dimensioning. First, we could write 9/16 in. sq. where we already have the 9/16 in. dimension, or better still, we should place the dimension lines on the end view and mark plainly 9/16 in. sq.

The last point on this piece No. 3 is our marking in full, the fact that the piece is finished all over. Thus we have

A CAREFUL STUDY OF THE PLATE IS ABSOLUTELY ESSENTIAL. WE HAVE PURPOSELY MADE SEVERAL ERRORS, WHICH MUST BE CORRECTED ON THE FINISHED DRAWING. ABOVE ALL SEND US IN YOUR WORK.

shown three styles f.a.o.—fin. all over—and finish all over. Either one is permissible, and it depends on what office you are employed in, what system is adopted. To those working on the bench and machine we can only add, watch these little details, if for nothing else than for curiosity's sake.

At Piece No. 4, the first point we wish to call attention to is the snaky line leading to the note ¼ in. drill and cnsk. This style of wavy line is used by quite a number of offices in place of the straight line, such as the one on Fig. 3, leading to the 7-ths. per in. L. H. Note it is merely a matter of taste which is used, some claiming that the straight style of line leads your eye quicker to the dimension, while others claim that the wavy line attracts your attention more than the straight line. We show both types merely for illustration purposes. Note also on this view that we have marked under the title the words Piece No. M129. This system of keeping track of the details by piece numbers is worth while explaining.

The Method Involved

Supposing a machine was being built consisting of some 400 to 500 parts. To keep track of these parts without some system of numbering would be almost impossible, and result in needless waste of time, so the following plan is carried out. Some letter is taken to represent the machine. In our case M is used to represent the word miller. As a rule the numbers start at the castings, and are numbered up all through the castings first, then the steel pieces, etc., etc.

In other cases, some firms start at the base of a machine, and number consecutively all the pieces as they come up from the floor as we might say. The method adopted depends on the drawing office, but it is the fundamental principle that really counts. Keep track of the pieces, with some symbol and number, thereby eliminating waste of time and needless confusion. Students will note that we have left off the notation fin. all over on view No. 4. This is done in some cases where the draftsman figures to himself that anybody would know that the piece should be finished all over, BUT—and it's a large one, the draftsman has no business to imagine that anyone should know what his intentions are.

Fig. 5 illustrates the handle for the vise, and its only finished portion is at the handle grip. This is represented by the small f's shown. A very simple detail, and yet one not receiving the attention it deserves, is the one showing ¼ in., and which we have surrounded with a rough circle form, in order to call attention to it. Note that we have not the space to place our dimension between the arrow lines, so we carry the dimension out to one side, but also carry out a dimension line, or shall we call it a dimension attention line, to the ¼ in. This is always good practice. In any case where a dimension is placed outside of the regular lines, lead a dimension attention line to it. While this may not appear such an important point in a simple drawing such as shown, it is a very vital detail when used on an intricate drawing of any nature. By the adoption of this system, confusion is avoided.

Cut out and send with drawing

Name .....

Address .....

Position .....

Firm's name.....

We also made an error on piece No. 5, by merely stating 9/16 in. at the square hole through the handle. Does this mean you have to machine a 9/16 in. square hole from the solid? We hear the machinist say, "We hope not," and this remark is certainly called for. The dimension should be marked 9/16 in. core, in order that the patternmaker can make arrangements to place core prints on the pattern, ensuring the hole being cored in the casting.

We next come to Piece No. 6. First, we would call attention to the plan view. Note that in the representation of the tapped hole of square threads we show only a double line. This is permissible in some cases, especially where we have a section such as shown in the side view, which illustrates clearly the nature of the thread. Again we have left off the fact that square threads are wanted. We do this simply to illustrate how easy it is to forget the little term, square. Referring to the sectional view, we call attention to the fact that arrows have been left off, and dimension lines not completed in order to warn students of their danger. We leave them to pick these points out for themselves.

In representing ordinary tapped holes two methods are often adopted. Each of these methods is shown in the sectional view. First, the plain double line system is often adopted, as shown at A on the view, and second, the better method as illustrated at B is used. While the latter takes a little longer, it is plainer and gives at a glance the information.

The front view of this piece has a very good illustration of what we meant by a dimension attention line. Note the dimension 11/16 in. radius. Here we have a case where, to place the dimension inside the dimension line would make it crowded, but by leading a line out as shown, it gives the dimension prominence, and yet is not hard to discover where it belongs to.

In concluding this portion of the course, we wish to give students a little advice. Do not merely copy plate No. 11. Study it. Figure why each piece is made the way it is. Study your projection. Watch all dimensions, and above all do not make the same mistakes on your plate that we have on ours. We have done so purposely to point out the common pitfalls, and thus keep others out of them. Ink in your work with care, and if you care to do so use tracing cloth. We do not make this a necessary stipulation, simply because we may have some students who do not care to go to the expense of having cloth. If you so desire, send work in on the regular drawing paper.

Lately, some of our students are adopting the easy (?) method of WRITING in their name and address on the title.

Such a practice should be avoided. Lettering practice is what the title is there for, so print in every item, do not write a word of it. Please watch this point in future.

Next plate, we will go further into the details of this vise. Send your work in promptly, and let us know how the course is interesting you.

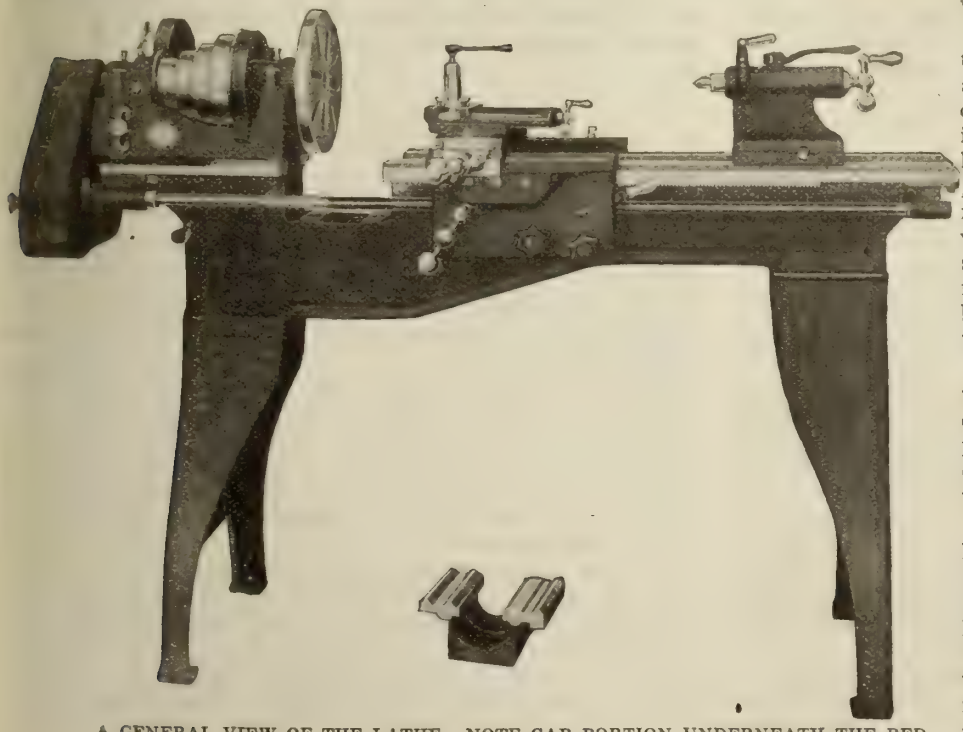
German silver is manufactured in three general ways. It is composed of nickel, copper and zinc in varying proportions. The German method of manufacture is to melt all the copper to be used in the mixture, and two-thirds of the nickel and zinc, in a graphite crucible and then add the rest of the nickel and zinc. In the English method, the copper, nickel and zinc are melted all at one time, then more copper and zinc are added. Should the metal appear porous, a fire-clay pipe containing pitch is pushed into the metal mixture to deoxidize it. There are several American methods. According to "Indian Engineering," one is to melt a copper-nickel alloy and then gradually add the preheated zinc. In another method mone metal is used as a base.

The feasibility of using waste hemlock bark from paper-mill operations for tanning purposes has been demonstrated in recent tests made by the Forest Products Laboratory of Madison, Wis. It is asserted that the product is satisfactory to the tanner and can be prepared at a cost that will allow it to compete with leaf bark. The use of paper mill bark for tanning would mean a source of income for paper mills from a material which is now considered of little value, if any.

DEVELOPMENTS IN SHOP EQUIPMENT

STAR GAP LATHES

The Seneca Falls Manufacturing Company, Inc., Seneca Falls, N. Y., have just brought out two sizes of Gap Lathes 11 in. x 18 in. swing and 13 in. x 21 in. swing. In designing the "Star" Gap Lathes, the extra capacity feature of the "Gap" has been added to the quality, convenience and efficiency of the well-known "Star" Screw Cutting Lathes.



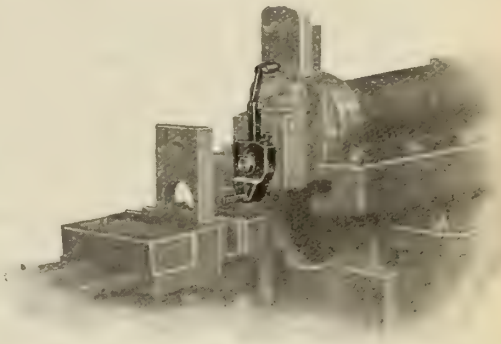
The bed is of the box section type, thoroughly braced by cross webs and made very heavy through the Gap section to insure usual "Star" Lathe accuracy. A bridge piece is furnished to close up the Gap when the extra swing of the Gap is not needed. Beds are made 5, 6, 7, 8, 10 ft. long.

The carriage has the cross slide placed at left hand for convenience. The cross feed screw is supplied with micrometer collar graduated in thousandths of an inch. The apron has safety device so that longitudinal feed and split nut cannot be engaged at the same time. Has extremely wide range for screw cutting all standard threads from 3 to 72, including 11½ and 27 pipe threads. Can be equipped with transposing gears or metric pitch lead screw for cutting metric threads.

An unusually large line of attachments, including raising block, quick change gears, taper attachment, motor drive, draw-in chuck, milling and gear cutting attachment, turrets, relieving attachment, etc., may be used on the "Star" Gap Lathes.

NEW SAW TABLE

Woodworking plants of all kinds will be interested in a description of a new saw table produced by the D. MacKenzie Machinery Co., Guelph, Ont. The table will take the same work as one of larger dimensions, although it is only 23½ in. by 30 in., the distance from saw to ripping fence is 12 in. by 13 in., and the floor space 3 ft. by 3 ft. 6 in. The machine is adapted to electric or gasoline drive, and each is furnished with belt, ripping fence, two mitre fences and 9-inch saw. It is a useful machine not only for furniture, piano and sash and door factories, lithographers, contractors, pattern shop, etc., but is also designed to meet the requirements of technical and manual training schools. The saw table will prove an important addition to the McKenzie line of power hack saws, sensitive bench drills, shapers, and 14 in. by 6 ft. and 8 ft. engine lathes.



A GENERAL VIEW OF THE LATHE. NOTE GAP PORTION UNDERNEATH THE BED.

BRUNO SLOTTING ATTACHMENT

The H. H. Moore Co., Rochester, New York, have placed on the market what is known as their Bruno Slotting Attachment.

This attachment, or cutting tool holder, can be used on shaper or planer, and makes internal shaping of any description, such as dies, jigs, gauges, keyways, possible.

VIEW SHOWING FIXTURE AT WORK.

The attachment is simple in construction, made of high-grade steel, heat treated, hardened, and fully guaranteed. It is applied to the shaper as quickly as you can change a tool in a tool post, which makes it practical and efficient.

You will note that the tool is bolted to the Clapper in place of the tool post, allowing the use of very short, stiff cutting tools, as no projecting tool post is in the way necessitating the use of a long, slender, springy tool. The tool is provided with an adjustable friction arm riding on the head slide, which prevents vibration of the tool in operation at any speed. The cutting tool is made from round or square stock, and the tool can be turned in any position, to cut on bottom, sides or top.

These attachments are now in use in the most exacting shops, and reduce the cost of die work, approximately, fifty per cent. Large dies are handled as easily and successfully as small dies, there being no tool post in the way.

The attachment is made in three regular sizes. No. 0 taking ⅜-in. to ½-in. round shank tool; No. 1 taking from ½-in. to ⅝-in. round shank tool; and No. 2 taking from ⅝-in. to ¾-in. round shank tool. Each size is furnished with two cutting tools, sharpened and ground ready for use. The net weight of the attachment is 5 lbs.

The Exchange Situation

VARIOUS views are taken in regard to the exchange situation. The man who has a shipment coming from United States that he must pay for, realizes that to him it means a straight increase in his purchase price of 10 per cent. or so, depending on the exchange rate on the date of delivery. To the man who is selling an article in competition with a similar line sent in here from United States, it means an added protection of ten per cent.

Britain's coinage is being more closely sliced than the Canadian, but to all intents and purposes Britain is not worrying about the matter, and is taking no steps to have the matter righted.

The "Wall Street Journal" takes this interesting view of the situation:—

"The United States is the only country that is not alive to the international situation. England is getting away with the world's business. The fall in sterling gives her a 25 per cent, protection against imports and a 25 per cent. stimulus to exports, but back of her is a country with still lower exchanges, and England, as mistress of the seas, is gathering up the cheap goods that Europe is starting to pour forth and is passing them over the world at handsome profits. She buys low in Europe, and will soon be selling at high prices in the States.

"In three years England will be the commanding commercial and trading power of the world, and as she stood as the bulwark of democracy and freedom, we shall not regret it. I rather think she is entitled to all she can get. She has been on the seas and in international trade for a long time, and she knows markets over the earth as does no other nation."

United States exporters recognize the situation. They can see that their sales are harder to push with the exchange handicap against them. Many of them, irrespective of any national move, are taking steps to have accounts in various countries where payments can be made at par in the currency of these lands.

It's small advantage to United States to have its money worth more than the money of other nations when outsiders simply stand back and wait for conditions to right themselves. Meanwhile the world will be inclined to buy where its dollar, its pound, or its franc will carry the greatest amount of weight in paying bills.

Graded Certificates

INFORMATION has been published concerning the Act grading certificates for a sufficient length of time to enable an estimate as to its reception amongst the engineering fraternity. Generally speaking, opinion seems to be favorable to the Act, although some objections are raised to individual portions of the Act and the regulations respecting it.

The point to which the greatest exception is made is perhaps that relating to the qualifications for a first-class certificate, both as regards practical experience and technical knowledge. At first glance the qualifications may seem somewhat severe, but in no other way can the status of stationary engineering be raised so effectively. The first-class certificate should be one well worth while having, and to achieve this, it must be a fairly hard thing to obtain.

When employers of engineering skill learn that the standards set by the Ontario Board are high and demand genuine worth on the part of the engineer, it will be materially to the benefit of the stationary engineer himself. His pay envelope will undoubtedly be fatter and his reputation more in keeping with his worth.

It may be argued that the first-class certificate will only be available to the limited few and that injury will be done to the older men of the present engineering world. This may possibly be true, but a remedy should not necessitate the lowering of the standard but rather a readjustment of the graded plant requirements. This could be done easily by the Board under Order-in-Council as soon as it were found necessary and with the experience gained during the coming year it will be more fitting to discuss this question later on.

It might be well emphasized that although the engineer cannot obtain a first-class certificate on his application form, much depends upon the manner in which his application form has been filled out, whether he obtains a second or third-class certificate. The application blanks have been issued for a definite purpose and this purpose, briefly stated, is to give the engineer every opportunity to obtain the highest grading possible.

Men Or Mushrooms?

IT is a very easy matter to walk along any of the downtown streets of our cities and see in the shoe-shine parlors a string of boys and young men getting their shoes shined. Very often included in the string are a number of youngsters in short trousers, and the percentage of those who have still to have their first shave is fairly large.

Now, shining boots is all right. Not a word against that. But what is the matter with these young dandies shining their own shoes?

If shoe-shining were confined to those who were not able to do the job for themselves, there would not be work for more than a corporal's guard of these foreigners in every community.

But there they sit, lads fourteen, fifteen and sixteen, generally with a cigarette butt growing in the side of their face, with a foreigner prancing around shining shoes for them.

Small wonder if one were minded to ask if we are raising a generation of men or a crop of mushrooms?

Are Getting Results From Their Efforts

Men Appreciate a Share in Direction of Industry—The Position of the Engineer in the Community

R. W. GIFFORD, of the Massey-Harris Co., spoke before the Toronto Section of the American Society of Mechanical Engineers on February 2, and gave some interesting facts relative to industrial councils and welfare work.

About one and one-half years before the close of the war a change in management occurred, and Thos. Findlay was made president of the company instead of vice-president as formerly. A need for more amicable relations was apparent, and Mr. Findlay determined to build up for his firm a reputation in labor matters equal to that obtained by the implements manufactured.

No matter what system is adopted by any industry a few main facts must be clearly recognized and rigidly adhered to. The most important of those upon which the Massey-Harris Company base their work are as follows:—

A square deal for every employee, and each case to be considered solely upon its own merits.

A fair day's pay for a fair day's work.

Reasonable working hours.

Pension systems, welfare work and opportunities for financial interest in business are also important.

The scheme of organization of the industrial councils, the welfare work, the cafeteria system and other phases of the work were all dealt with by Mr. Gifford and the interested reader might refer to CANADIAN MACHINERY for July 31, 1919, for further details.

Remuneration continues to be a live subject in any industry and naturally has occupied the time of the councils to some extent. Results are seen in the following figures. The *Labour Gazette* estimates an increase in the cost of living of 66 2/3 per cent. The average wage increase over the whole firm is in the neighborhood of 105 per cent. Hours have been decreased, and with success, for when the nine-hour day was first put into effect 98 per cent. of the estimated lost output was made up.

Mr. Gifford illustrated his paper by means of lantern slides showing various phases of the work, and also by means of a moving picture illustrative of the cafeteria. A discussion followed, in which a number of those present took part.

Calvin W. Rice, secretary of the Society, was the second speaker of the evening, and throughout his talk emphasized the changing relation of the engineer to the public, and especially the importance of his taking part in the affairs of the nation and of the municipality in which he lived. Heretofore the engineering societies, without exception, have, primarily, focussed their activities on the advancement of science, and in particular that part of it which appealed to the branch under consideration. In this was seen the reason for public indifference to the engineer, his work and his remuneration, and it rested with the engineer himself to find a remedy. If the engineer, through his societies and by individual effort, would make himself more active in civic and national affairs, recognition would come almost in proportion to his participation.

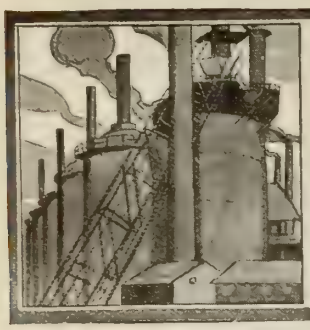
In passing it was remarked that while the cost of living had advanced so greatly, the compensation of the engineer in United States Government employ had only advanced 4 per cent., and in municipal employ, 12 to 14 per cent. The local engineering societies should affiliate with the local Boards of Trade or Chambers of Commerce, etc., and should take an active advisory part in municipal government. The ideal organization would also include student organization from the universities, these to be affiliated with the local bodies, and these latter in turn with the national societies. Mr. Rice gace much information relative to the functioning of the engineering organizations in the United States, and spoke of the war work carried on by their assistance.

How the Locomotive Whistle Came to Life

A Musical Instrument Maker Solved the Problem—Horseback Rider Used to Precede the Locomotive

By F. A. McLEAN

SURROUNDED on every side by wonders of the mechanical and electrical world, the majority of people are disposed to take them for granted and regard them more or less as if they had always been. As a matter of fact, there is usually an interesting story behind the invention of most of the things that are now considered essential to our everyday life.



How many people, for instance, could tell offhand who invented the locomotive whistle or know that it came into being like many other epoch-making inventions and discoveries as the result of an accident. An apple falling on the head of Sir Isaac Newton, as he lay under a tree, is said to have started the train of thought which led to the promulgation of Newton's law. Bell stumbled onto the telephone accidentally while working on an apparatus to improve the hearing of the deaf. The phonograph was born while Edison was working on an entirely different invention. A lazy boy gave us the first automatic valve motion for a steam engine, while Elias Howe is said to have conceived the sewing machine needle in a dream, so that it is not at all strange that the invention of the locomotive whistle was also brought about by an accident.

On May 4th, in the year 1833, Stephenson's locomotive the "Samson"—a successor of the famous "Rocket"—ran into a farmer's wagon containing fifty pounds of butter and eighty dozen eggs, on a level crossing between Thornton and Bagworth, England. Had the high cost of living been a topic of discussion at that time, or had butter and eggs been worth as much in those days as they are now, perhaps Stephenson's career as a railroad builder would have been cut short.

At any rate, as a result of this spreading of butter and eggs around the landscape (and perhaps as an aftermath of the death of William Huskisson, a Cabinet Minister, who was killed by Stephenson's Rocket on September 15th, 1830, and thus had the unfortunate record of being the first man ever killed by a locomotive) a meeting of the directors of the railroad was called to see what steps could be taken to prevent accidents in the future.

In 1825, when the Stockton and Darlington Railway was opened, for the first part of the trip, a man on horseback had preceded the locomotive, warning people to get out of the way, but during the latter portion of the trip Stephenson ordered him out of the way and speeded his engine up to fifteen miles an hour. The Samson being a heavier and more powerful locomotive than the famous Rocket and other earlier models, sending a mounted man ahead of it was now out of the question, so Stephenson's suggestion that a whistle blown by steam could be used, was welcomed by the directors.

Acting on Stephenson's advice, a musical instrument-maker in the town of Leicester produced a steam trumpet which was about eighteen inches long and about six inches across the bell, and resembled a huntsman's horn. This horn was tried out before the board of directors and accepted. It must have had a weird sound, and no doubt was effective, as we are told that the Reverend Sydney Smith, a witty divine, was wont to say that "Stephenson's whistle always reminded him of the squeal of a lawyer when the De'il first got hold of him."

MARKET DEVELOPMENTS

Runaway Market Coming in Steel Trade Soon?

Prices Mounting Rapidly and Many Sales Going Through Record New High Marks in Selling—Inquiries Coming in Much Better for Machine Tools—Scrap Iron Comes High

NO person in the trade would care to become responsible for the prediction that we are approaching a runaway market in the steel industry, but it does look as though the agency were lacking that at this time could come forward and put a peg in the premium market. Quotations for odd lots are getting farther away from a cost plus basis. It is very often a case of what can be secured, based largely on the urgency of the sale, and the ability of the seller to deliver the goods. One report has it that plate tonnage has been placed by Canadian buyers as high as 4.50 Pittsburgh. Local warehouse prices were also advanced this week on plate and sheets.

Machine tool inquiries are reported as improving this week. It had been thought that the exchange situation was holding up considerable business, and that inquiries were held back pending some improvement in this. Apparently this is not the case, as several dealers say it does not stop sales. The only effect is to give Canadian material and goods a preference and to boost the sale of used machinery.

An announcement is made of an increase in American-made carbon drills, and it is not unlikely that the Canadian-made article will find it necessary to take similar action.

Scrap iron is in great demand at present, and it is doubtful if much of this could be secured under $40 a ton, which is a fancy price. Some of the dealers state that they look to see it worth as much as pig iron. Foundries want it, and there is a scarcity. During the war a great deal of it went out of the country for keeps in the shape of base plugs, etc., and much of it was used in war machinery.

EXCHANGE RATE BOTHERS TRADE IN THE MONTREAL MACHINE FIELD

Special to CANADIAN MACHINERY.

MONTREAL, February 5.—The all-absorbing subject of the present day appears to be the complex problem of exchange and its effects upon the business of the country is one that cannot but impress those who in any way have transactions with American houses. It is undoubtedly true that much business has been diverted to Canadian firms who are in a position to take care of the needs of the buyers in this country. Not only is it a big handicap in carrying on business but it has the tendency to hold up contemplated expansion in many directions. Where material must come in from the States great difficulty is frequently met in getting the purchaser down to the point of closing a sale, as the high exchange rate means considerable additional outlay in the buying of equipment. Action has been taken in many cases by American manufacturers to overcome this objection, and bank accounts have been opened in some of the leading Canadian cities whereby it is possible to meet the requirements of those in need of material without assuming the burden of the excessive exchange. While the present conditions are, in a measure, to be regretted, there is, nevertheless, a favorable side to the problem. Just this week CANADIAN MACHINERY was approached by a representative of a machine tool house in the States, as to a suitable local well-equipped plant that would be in a position to take care of their Canadian and British trade, by manufacturing here, thereby overcoming the question of the high exchange rate and duty charges.

Acute Condition in Steel

There are still no signs of relief in the general steel situation, and consumers are still pressing the dealers for delivery of materials, but the dealers in turn must abide by the wishes of the producers, who are unable to adequately meet the present trade requirements. The warehouse conditions are going from bad to worse, and little can be done to replenish supplies as material delivered can find a market almost before it is out of the cars. The situation is becoming more and more acute, and the existing tension will be greater before it is less. The general conditions are reflected in the higher base prices effective this week on plates. While $3 is quoted as the ruling figure, the leading mills have only advanced to $2.75, but this price only applies to delivery at mill convenience, which may be reasonably placed at from six to eight months. If a customer must build a tank or a stack immediately he could probably get the desired material by paying a good premium over quoted prices. This is by no means an uncommon procedure. Local dealers are deferring any advances but intimate that those quoted can only be considered as nominal and must only be taken as a guide for indefinite delivery. The clouds of uncertainty are becoming denser every week, and looking into the future is becoming more and more difficult.

U.S. Firms May Manufacture Here

An interesting condition that is arising out of the seeming complexity of international exchange is the attitude taken by some American business houses to solve the problem of diverted orders that would, in the ordinary course of events, be placed with United States firms. It was announced recently that some American manufacturers were taking steps to counteract the heavy exchange rate by dealing with the Canadian buyer direct. This method of striking a balance has apparently given note to another, and this is exemplified in the scouting process of some American tool manufacturers in the effort to find some local engineering plant that

j equipped to make their line. One merican firm has a representative in ontreal this week casting about with is purpose in view. There continues be a fair demand for general purpose uipment, but as one dealer stated, the certain delivery has impressed many ms with the imperative need of mak- g the best machinery on hand. The ght revival in the demand for used ols is a barometer of current condi- ons. The market is showing the after- ath of war in the greater distribution British-made tools, particularly of the aller variety of machines, accessories nd supplies.

Scrap Metal Market

There is still a passive condition ex- ibited in the old material market, with usiness on the quiet side. Considerable ctivity is shown in local sales, the foun- ries taking regular supplies for current se. No attempt is made to accumulate arge supplies, and as a matter of fact his could not very well be done as there s little surplus of cast iron scrap. Dealers are holding to prices quoted, but state that same should be taken as ominal quotations only.

MANY INQUIRIES FROM WIDE FIELD

Business Reported as Very Satisfactory —Some Prices are Going Up Again

TORONTO.—Improvement is reported in several lines of the machine tool and supply business. Inquiries, accord- ing to reports received by CANADIAN MACHINERY in this district, are com- ing in from a well-distributed line of in- dustries. Some are for new concerns that are just commencing business. They are in the market for a long list of machinery. In other cases existing con- cerns are adding to their equipment. It all helps to make up a good-sized volume of inquiries and orders.

Some of the dealers appeared to think that buyers were holding back during the last week or two, waiting, among other things, to see if anything were go- ing to come of the exchange situation that would make prices any more favor- able for them. "Exchange is stiff," re- marked one manager to-day, "but it really is not a determining factor in the placing of business. I cannot recall an instance offhand where a customer has declined to buy because the exchange has stood in the road. There is no doubt, though, that it is helping the sale of Canadian and used machinery."

There is talk of some price advances in the supply market. The lines that may be changed are hack-saw blades and chain blocks, although no action has been taken yet.

Prices are Moved Upward

Sheet and plate were both marked up in the local warehouse lists this week. Sheets, No. 28 box annealed, are now sell- ing at 8c per pound, and No. 10 at 7.50. Plates, ¼ inch and up, are now priced at 6.50, and 3-16 in. and up, 7. These prices are simply a reflection of the higher prices being asked at the mills, where all base prices are up above the high prices of a week or so ago.

Even at the advanced prices that are prevailing the mills are not showing any tendency to accept business. This rather does away with the theory that was held by some of the dealers a while back that mills were refusing business, waiting for higher prices to prevail. If they had been doing this they would have a great chance to come out into the market now and sign up all sorts of business at a very respectable premium. As a matter of fact it is not possible to book business for plates, sheets or tubes at any price. It had been held for some time that premiums would bring out mill capacity when they were offered, but there is nothing in sight to substantiate such a view. There are plenty of rumors around as to the prices that are being offered and paid for decent shipment of material. Of course there must be some- thing allowed for the imagination in the spreading of these reports, but CANA- DIAN MACHINERY heard of one case this week where as high as 4.50 base Pittsburgh was paid for plate.

There has been a change made in the method of selling cold-rolled steel. For- merly it was sold at a list price plus, while now it is quoted at 6.25 with extra for sizes.

Warehouses report that there are many inquiries just now, and that there is no difficulty in disposing of all the material they are able to secure from the mills.

The Small-Tool Market

Makers of American drills have ad- vised the trade of an increase in the price of carbon drills, and it seems like- ly, according to reports in the trade, that Canadian makers will make a similar move. American carbon drills have been sold here at 50, 10 and 5 off, while the price now is 50 off. The Canadian-made drill has been sold at 40, 10 and 5 off, and although there is no announcement out yet, it would occasion no surprise were the price to go to 40 off.

Dealers report that business is excep- tionally good and that inquiries and sales are coming from a large number of in- dustries. Most of the business is in the form of small orders, and in one sense these small orders are more desirable than the larger ones because in the lat- ter there is apt to be a persistent demand for some special price arrangement in order to land the business.

The Canadian National Railways are out with a very large specification now, covering some thirteen pages, composed mostly of milling cutters. This is for the purpose of tooling up the equipment that has been placed in the St. Malo shops.

The Scrap Metal Market

The scarcity of cast iron may be said to constitute the only feature in the scrap metal market this week. The foundries all over the country are after it, and one dealer made the prediction that he would not be surprised to see scrap iron going higher, or as high as pig iron before very long, and pig iron is quite a respectable price, too. This condition is largely an outcome of the war, as before that there was always plenty of scrap iron in the country. During the war, however, there was a very keen demand for this line as it was used for making base plugs, and lots of it went into war machinery, etc. The result was that the country was raked fine of its cast scrap, and there has not been a supply coming in since the war to level off things. It is doubtful if the dealers who have any scrap could be induced to sell it under $40

POINTS IN WEEK'S MARKETING NOTES

Pittsburgh advices state that a wide variety of prices are being quoted and that prices are being rapidly advanced in some quarters. A runaway market is believed to be at hand owing to lack of stabilizing influences.

—

The U. S. Steel Corporation have announced a 10 per cent. increase in wages to common labor and adjust- ments in keeping to skilled labor. No present intention is evident to adding this to selling prices.

—

Transportation has been the chief factor in holding down production for the last fortnight, from the mines, by-product coke ovens and steel mills.

—

Toronto warehouse prices for plates and sheets were advanced again this week.

—

It is possible that cast iron scrap will reach a price as high as pig iron. The country was raked clean of this kind of scrap during the war, and the gap has never been filled since.

—

Makers of American carbon drills announce an increase. They have been selling at 50, 10 and 5; the price now is 50 off. Canadian makers may announce an increase, but nothing is known definitely yet.

—

The Canadian National Railways have sent out specifications for a large order of milling cutters for the St. Malo shops.

—

Inquiries are showing a decided improvement for machine tools, the inquiries being from a wide field and various lines of industry.

BELGIANS HAD BUSINESS TO PLACE BUT WANTED IT ALL "AT A PRICE"

Special to CANADIAN MACHINERY.

NEW YORK, February 5.—While the Eastern machine-tool markets continue fairly active, no new projects of importance have come to light in the past week. There is continued buying by some of the large interests such as the General Electric Co., American Locomotive Co., Willys Corporation, and other companies that have been active buyers for some weeks past.

An important consolidation of ship repair interests has been effected by the Lord Construction Co., New York and the Weehawken Dry Dock Co., Weehawken, N.J., under the name of the Lord Dry Dock Co., which has a capitalization of $10,000,000. A new dry dock and ship repair plant will be constructed, plans for which had been under way for some time by the Weehawken Dry Dock Co. It is planned to have the plant ready for service in eight months. Equipment for various metal and woodworking shops will be required.

The French commission sent to the United States to make selections of machine tools from the surplus stocks of this Government, has arrived, and will purchase up to $25,000,000 worth of such equipment. Financial arrangements have been made whereby French 10-year bonds will be deposited in payment. The commission is made up of ten persons, who will remain in this country until their work is completed.

A Belgian commission, headed by Lieutenant Jean Jean, has been in this country for several weeks on a similar errand and has been only partially successful in finding the equipment it desired. This commission came with lists of tools desired by various Belgian manufacturers, and the tools which the Government had to offer did not completely fill the requirements. After the Belgians had selected from the Government surplus all of the tools that their countrymen could use, there still remained unsatisfied requirements totalling about $2,000,000 in value. The War Department asked American machine-tool manufacturers to make bids on this equipment, and indicated a wish that the American manufacturers sell at prices approximating those which the Government had quoted. As these prices were only slightly in excess of the 1914 valuations of such tools there was a lack of response from the American manufacturers. As a matter of fact only two offers were made by American manufacturers and these included commissions which the American manufacturers believed were due to their Belgian agents if any such transaction was entered into. Consequently the Belgians will return home with considerable equipment still to be bought, and the belief prevails in Washington that most, if not all, of this equipment will be bought in Germany.

The War Department has disposed of a considerable part of its war surplus. Sales in 1919 amounted to $4,979,633.84, which represented a recovery of 59 per cent. of the purchase prices. The total sales of all commodities during the past year by the Director of Sales office for the War Department amounted to $552,748,555.60, an average recovery of 73 per cent. of the cost price.

RUNAWAY STEEL MARKET HAS BEEN STARTED BY INDEPENDENT INTERESTS

Special to CANADIAN MACHINERY.

PITTSBURGH, February 4.—There has been another and radical change in the price outlook for steel. The prospect that the market would be stabilized by the independents on some regular basis has already practically disappeared. The independents had previously renounced Steel Corporation leadership by refusing to sell at the March 21 or Industrial Board prices, to which the Steel Corporation has adhered, but there remained the possibility that they would advance merely to the January 1 prices, those ruling before the Industrial Board reductions, or even to the war control prices, and stop there.

It has been made clear in the past week that the independent producers are not doing anything of the sort. They are quoting a wide variety of prices, while some are not quoting any prices at all, indicating clearly that they are waiting for higher prices still to develop.

Plates, bars, wire products, Old Country goods and sheets have all sold at higher than the war control prices, in larger or smaller quantities. A common mill price for wire nails is $4.25, against $3.50 under the war control. Plates in moderate-sized tonnages have sold at 3.50c to 4c, against the war control price of 3.25c. Bars have brought approximately the same prices, the war price having been 2.90c. Sheets have shown a wide range of price, mill sales being made up to 6c, when the war control price was 5c, and the Industrial Board price, at which the Steel Corporation sold its first half output, is 4.35c.

Runaway Market

These developments mean not that a runaway market is likely to come, but that a runaway has already started. When there is demand in excess of the offerings, when prices have departed from a stable and easily quoted level, and when producers show no disposition to hold prices down, it is a runaway. Prices will advance until buyers can no longer pay advances, and then there will be the reckoning. It is quite impossible to attempt to predict how long the runawa will last, for that depends not merel upon the actual relation between re quirements and offerings, but also upo what is in the minds of buyers, for th buyers may help to put the market u on themselves. They have already don this, indeed, for some have made bid to mills in hopes of tempting them t enter orders, and have shown that the overrate the demand prospects. The are, for instance, reckoning upon a rail road raise this spring and summer fa in excess of what is likely to develop The railroads are not going to be reall large buyers, at least at the outset, whe the Government control is relinquishe March 1.

The runaway may be over by nex July or it may last through next winter The end is hardly likely to come at a intermediate time, for if the market ha strength enough to get through the sum mer it would presumably be able to ge through the fall without difficulty. The extent of the runaway is equally in doubt. The 1899 runaway saw maximum advances over the low points of 1898 as follows: Sheets, 86 per cent.; shapes 125 per cent.; plates, 175 per cent.; bars 175 per cent.; billets, 175 per cent. The outcome of the runaway was unfortunate, and since then the steel manufacturers have endeavored to avoid a runaway, except that in 1917 it was only the Steel Corporation that endeavored to hold prices down, the advances by independents being stopped eventually by the prospect of Government price control, afterwards realized.

Wage Advance

Last Friday the United States Steel Corporation announced a general wage advance, effective February 1, amounting to 10 per cent. in the case of common labor, with adjustments in keeping for skilled labor. Most of the large independents have already announced a corresponding wage advance, and all will necessarily have to make the advance. It is interesting to observe that at this time, while it is the independents that advance steel prices, it is the Steel Corporation that takes the initiative in advancing wages, and the Corporation has since announced that it has "no present intention" of advancing prices in connection with the wage advance. Even if it did advance prices at the same time as wages, it would be out the wage advance as to approximately a half-year's full output, as it has sold fully that amount at the March 21 or Industrial Board prices.

The war period wage advances began with that of February 1, 1916, and ended with that of August 1, 1918, there being afterwards, October 1, 1918, what amounted to a wage advance for men working more than eight hours, as the basic eight-hour day was then instituted, time beyond eight hours being rated time and a half. The common labor rate in 1915 was 19 cents an hour, the successive advances carrying the rate to 42 cents, while the eight-hour day made the actual pay for twelve hours' work fourteen times 42 cents, $5.88, or about 49

cents an hour for the time actually on duty.

The present 10 per cent. advance raises the basis rate for common labor to about 46.2 cents an hour, making $6.47 for a twelve-hour day, against $2.28 in 1915, or 184 per cent. advance, the pay being almost tripled. The ten-hour day is increased from $4.62 to $5.08, against $1.90 in 1915. The amount of twelve-hour labor has been further reduced in the past few months, more men working ten hours and eight hours than formerly, and possibly it is the expectation that the twelve-hour day can gradually be eliminated altogether. As there has been a fair supply of labor in the past few weeks it is possible that with the present wage advance there will be such accretions as will enable more work to be put on the shorter hours.

Production

Production has increased very slowly, if at all, in the past fortnight, the restraining influence now being insufficient transportation, which has prevented any further increase in Connellsville coke output for about a month, and has enabled the by-product ovens to operate only a trifle better, while it has also threatened finishing mill operations by forcing finished product to back up against the mills. Winter weather should be past in a very few weeks, however, and then the railroads will undoubtedly function much better. While much is being said about the railroads needing more cars, and about many cars being out of repair, the main cause of transportation being slowed down is the effect of bad weather upon the working forces. The weather will correct that, and it is thought also that many men will work better when the lines are transferred from Government to private control March 1.

Pig Iron

The pig iron advance that was interrupted more or less by the holidays has been resumed in full force. Foundry and basic have advanced to $40 valley, and Bessemer to $41, malleable being $41.25. In foundry and malleable the furnaces have practically nothing left to sell but second half output, and those that are now selling for that period assert that they are merely accumulating "backlog" business, thus presaging further advances. The sellers seem to have things entirely their own way, and how long this condition will continue is problematical.

U. S. SCRAP METAL

The scrap market has been particularly active during the past week and prices in some cases have made considerable advances. An interesting feature is seen in the advance in No. 1 machinery scrap, which at centre has advanced in price above pig iron. Following are reports from various U. S. centres:

PHILADELPHIA. — The activities of the small buyer have served to maintain the strength of the local market. Several thousand tons of heavy melting steel sold to one customer for $26.50 and 1,000 tons of railroad malleable sold for $29.50.

BROCKVILLE TO TRY NEW SCHEME

Citizens Called in Meeting Decide to Start Campaign for New Industries

Brockville.—Local support of local industries was the chief topic of discussion at the citizens' meeting called by Mayor Lewis with an attendance of some 350 ratepayers. The institution of a campaign to raise the sum of $5,000 annually for three years to pay with an equal sum which the Town Council and Public Utilities Commission will be asked to provide for the maintenance of industrial propaganda work was decided upon by the meeting.

There is now a surplus of 8,000 horsepower in the St. Lawrence Hydro-Electric System, with which Brockville is now hooked up, and if this were made use of the chairman of the Public Utilities Commission stated that the rates would drop from $25 to $18 per horsepower. This will be utilized to attract American industries here.

In connection with the meeting it was decided to organize an investment company to sell bonds to local subscribers for the purpose of investing the proceeds in industries which decide to locate in Brockville. Mayor Lewis announced that applications had been made to Toronto for provincial funds to erect 15 houses under the housing commission plan.

PIG IRON MARKET

Heavy selling of iron for last half delivery still continues. A large tonnage of basic is being sold. Following are the reports from U. S. points:

CLEVELAND.—Large sales of foundry and malleable iron are reported to have reached a total of 175,000 tons for the last week in addition to 50,000 tons of basic at the prevailing price of $40. Foundry iron, 1.75 to 2.25 silicon, is selling at $40 furnace, although higher has been paid.

NEW YORK. — Foundry grades here also lead the market, and as in other centres purchases for second half delivery have predominated. Sales totalled 50,000 tons.

ROTATING BRASS FURNACE

Continued from page 161

to bring down the cost of melting and upkeep charges.

Since this type of furnace is new, and we have only had a short time from which to obtain operating data, we cannot get proof from actual records just what the cost of these items will be. The important fact remains, however, that the small furnace described in this paper was successful from the very first heat, and has been in daily operation without shutdown from the time the power was first turned on, and the lining does not show any appreciable wear. We are confident that, after a suitable length of time has elapsed, the power consumption and other data obtained will show that there is a great advantage to be obtained in rotating the furnace completely.

10. The rotation of the furnace not only preserves the lining and secures a low power consumption, but at the same time serves to mix the metallic charge, making it more uniform without requiring much supplementary stirring. Except in the case of mixtures with high lead content, the rotation of the furnace will sufficient mix the charge so that it is not necessary to stir same either in the furnace or in the ladle. This is quite an advantage and results in a more uniform product.

11. In the past the construction of electric furnaces has been along lines which require the use of special electrical appliances and equipment. This Booth Electric Furnace is a departure. It is entirely practical to operate it using the ordinary 110-volt single-phase service which can be obtained from most public service companies.

12. All details of the furnace equipment are rapidly being standardized so that quick shipment can be made of furnaces, as they are shipped completely assembled and the production and installation is a simple matter.

In case automatic electrode regulator control is desirable, it should be pointed out that only one regulator would be required, and this would reduce the investment cost materially.

13. In the design of large-size furnaces of this type, we have plans perfected for completing the equipment so that it can be operated using either two or three-phase alternating current instead of single-phase. This would be important in many cases where public service companies are not in position to handle single-phase loads over 75 k.v.a.

We are convinced that the time is ripe for the adoption of an electric furnace for the melting of non-ferrous metals. For melting of steel and metals requiring a higher temperature, the electric-arc type furnace has proven to be the most commercial type of equipment which has yet been developed. The disadvantage of the arc type furnace for melting metals at lower temperature has caused inventors to develop furnaces using other methods. These methods require special electrical equipment, however, which must increase investment cost. The Booth Electric Furnace has been put on the market because, as engineers, we believe that an arc-type electric furnace was practical for this purpose and could be built at lower cost than any other type of equipment, and was so simple electrically that the average brass foundryman could operate it without requiring expert handling. The results obtained to date with this first small furnace are convincing and prove that the principle of design incorporated into our equipment will be successful in securing all these advantages which are sought and claimed for electric brass melting furnaces without the disadvantage of high investment for special equipment and the necessary supervision which the same entails.

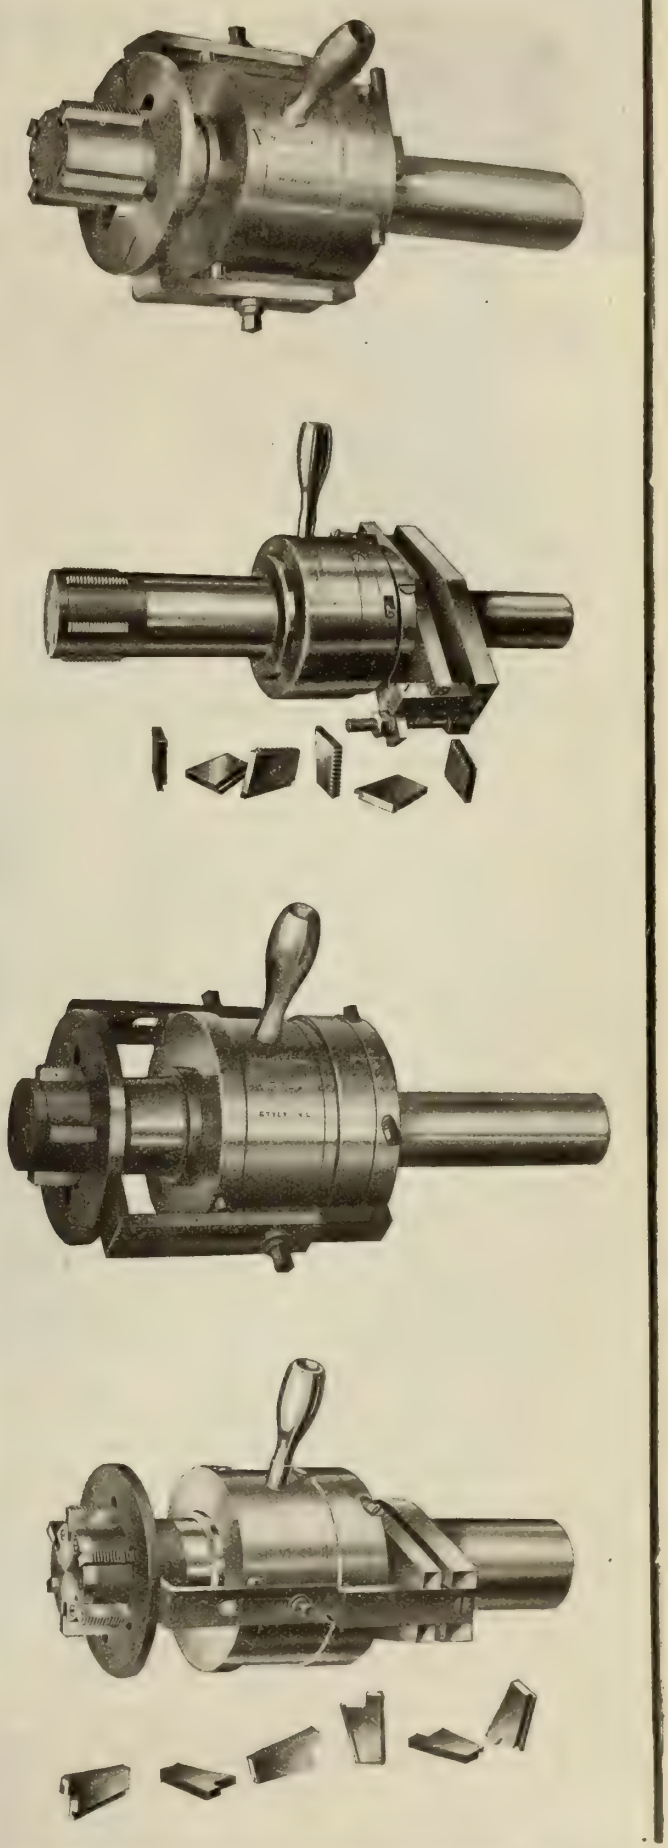
GEOMETRIC

Adjustable Collapsing Taps

Have overcome all the expense and annoyance of tapping screw threads with a solid tap.

Anyone doing thread tapping knows what backing out a solid tap each time means. It usually means low production, poor threads, and worn out taps.

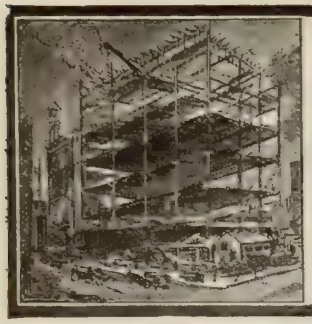


The mechanism of the Geometric Taps takes care of adjustment to correct diameter each time a thread is tapped, it collapses the chasers automatically, leaving a thread clean cut and perfect.

The chasers are readily reground, and when finally used up, are renewed at comparatively small cost, leaving the tap as efficient as when new.

The manufacturers of the Geometric line of Collapsing Taps and Self-opening Die Heads are justly proud of the distinction which is theirs:—

The Originators
and the
Largest and Best Known Manufacturers
of
Automatic Threading Tools



For cutting all classes of screw threads, internal and external, of any diameter and form.

The Geometric Tool Company
New Haven, Conn., U.S.A.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

TRADE GOSSIP

Foundry to Start.—A foundry company of American and Canadian capitalists, of which J. Gill Gardner, of Brockville, is the president, will this spring commence a plant on the Murray property in Brockville, which is to become an industrial area. At the start 125 hands will be employed.

The Chicago Flexible Shaft Company opened a New York office, February 1st, for the distribution of their furnaces, forges and heat-treating equipment. This office will be located at 350 Broadway and will be in charge of J. W. Lazear, formerly with the Brown Instrument Co. of Chicago.

Changes at Hamilton.—The Canadian Fairbanks-Morse Co. announce that Mr. R. V. Donaldson has been transferred from London to take charge of their business at the Hamilton branch. Mr. Dave White, who has been with the Canadian Fairbanks-Morse for some time in Hamilton, has started in business for himself in that city.

Warehouse at Windsor.—The contract has been let for the erection of a warehouse and showroom on Pitt Street E., Windsor, for the Canadian Fairbanks-Morse Co. The building will consist of two floors and basement, 50x100, with allowance for the addition of three more stories in the future. Work will be started on this at once as the company is desirous of securing the use of the premises as soon as possible.

Will Re-open Plant. — The Smith's Falls Malleable Castings Co. will shortly re-open its plant on the river front there after being in idleness for the last five years owing to the slump in malleable casting business. The company hopes to run the factory at capacity and to employ 200 men. The company has kept in operation a smaller plant in the north end of the town where 100 men are continuously employed.

New Light System. — Superintendent Williams, of the Canadian Pacific Railway, anounced that an automatic electric light system of signals is to be installed this summer on the 65 miles of Canadian Pacific railroad track between London and Toronto. The new system will save oil and labor. Mr. Williams also stated that practically a quarter million dollars will be spent by the C. P. R. on improvements in the division during the summer of 1920.

Kingston Industrial.—Mr. J. S. Sibbitt, former first vice-president, was elected president, and Mr. R. J. Bushell, was re-elected secretary-treasurer and manager of the Kingston Industrial Association. The other officers elected were: First vice-president, James Henderson; second vice-president, J. J. Wilmot; directors, Thos. Doyle, A. E. Day, C. Rogers, E. Cooke, E. Bradden, A. Weller, R. J. Moore, J. A. Wilson, James Baxter, H. J. Simpson, Herbert Orser and J. L. F. Sproule; auditors, C. F. Adair and J. B. Quinn.

WILL REPRESENT CANADA IN SCOTLAND

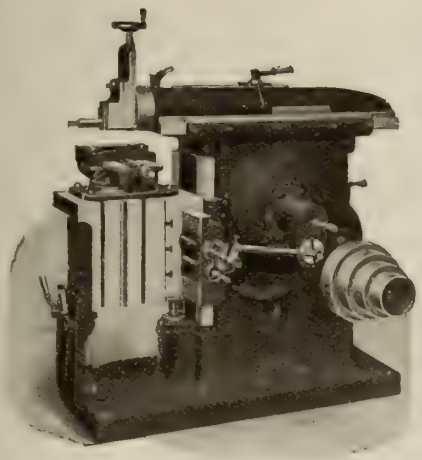
Lt. J. Vernon McKenzie will Study Canadian Conditions Before Leaving for Glasgow

Lieut. J. Vernon McKenzie, of the editorial staff of the MacLean Publishing Co., has received the appointment of Canadian Trade Commissioner to Scotland. Mr. McKenzie is a graduate of Toronto University and of Harvard, and prior to going overseas had a very wide

LT. J. VERNON McKENZIE,
Canadian Trade Commissioner to Scotland.

experience in Canadian and American newspaper circles.

It is the intention of Mr. McKenzie to make an extended inspection of Canadian industrial fields before taking over his duties at Glasgow, in order that he may have as much first-hand knowledge as possible of conditions in Canada as they relate to export trade to Scotland.

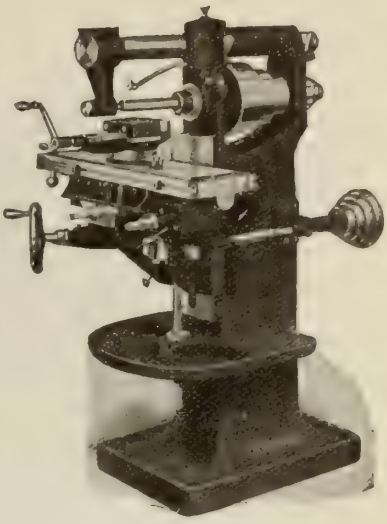


Guelph After Six. — The Industrial Committee of the Guelph Chamber of Commerce met and dealt with the application of six American firms who are anxious to locate their Canadian branches in Guelph. The landing of two or three of the firms for the city looks very promising. A sub-committee was appointed to deal with the formation of a Guelph Realty Company. Committees to look up detailed information on the following subjects are to be appointed: Power factor sites, taxation, water, transportation and education.

Duty on Autos.—The duty on automobiles and automobile accessories imported into the United Kingdom from the United States and other foreign countries is 33 1/3 per cent. ad valorem; but when imported from Canada and other countries of the British Empire there is a deduction of a third made in the duty—that is to say, the duty is 22 2/9 per cent. Second-hand automobiles are dutiable at the same rates. Special regulations are in force respecting the temporary importation of automobiles into the United Kingdom for touring and other purposes.

Foundry to Rebuild.—Fire which broke out in the main building of the Kyle Malleable Works, Merrickville, gutted the interior of that part of the foundry completely. Total destruction of the entire plant was prevented by the well-directed efforts of the volunteer fire brigade and for some time it was questionable whether they would succeed in saving the remainder of the building. Mr. Kyle states that he will have the works in operation again in three weeks. He does not intend to rebuild the building to its original height—three stories—but will construct a more modern plant, housed in a one-story structure. The loss was heavy but is fairly well covered by insurance.

Patents Issued.—The following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 156 Yonge street, Toronto, from whom further particulars may be obtained: Emile A. Fourneaux, the production of black upon textile fabrics; Alfred A. Lockwood, obtaining copper from its ores; John W. Myatt, loose-leaf books or binders; Auguste J. Rossi



Steptoe Shapers and Milling Machines

are built with a knowledge gained through seventy-four years' experience in the manufacture of high grade machine tools.

Shapers: 14 in., 16 in., 20 in., 24 in. equipped with ordinary belt drive or single pulley drive through gear box.

Milling Machines: 10 in., 15 in. and 19½ in. by 6¼ x 12, hand or power feed, with or without back gears. Can be equipped with vertical attachment.

Fitchburg Plain Cylindrical Grinders

are carefully designed to meet the great variety of cylindrical grinding requirements. It will meet all the present day demands for accuracy and high speed production and, owing to its compact construction, **occupies just half the floor space of the larger cumbersome machines.** It is most rigid and powerful. Construction is on the unit system, each unit being entirely independent of any other and can quickly be removed from the machine. Lubrication throughout is designed to reduce wear and friction to a minimum.

Made in following sizes:

6 x 20	6 x 30
8 x 36	8 x 54
12 x 36	12 x 54

Equipped with all automatic feeds and arranged for motor drive on request.

Ask us for complete specifications on this machine.

and C. J. E. Schroeder, paints; Louis E. Barton, composite titantic oxide pigments and methods of producing the same; Henry C. Minns, testing device for the ignition systems of internal combustion motors; Fred D. S. Robertson, process of extracting potassium from its insoluble compounds; John Russell, button-hole stitching machine; Predigest Food Co., Limited, manufacture of animal feeds from kitchen garbage and the like; Alfred T. Kwajel, magneto-electric machines for engine ignition purposes; John Yetton and W. E. Brockett, holders for wire staple belt fasteners; Philip T. Jackson, fluid control apparatus.

Toronto's Growth.—The report of the Toronto Industrial Commissioner for 1919 showed the following new industries located on city property during the year: Blackford Calf Meal Co., Canadian John Wood Mfg. Co., Chase Motor Truck Corp., Ltd., Clark Dental Mfg. Co., Columbia Graphophone Company, Consolidated Wafer & Cone Co., Ltd., Crane, Limited (valves), Diamond State Fire Co., General Fire Extinguisher Co., Great Lakes Oil Refining Co., Ltd., Herbert, Alfred Co., the Charles E. Hires Co., Ltd., International Metallurgical Co., Larned, Carter & Co. (overalls), Merchandise Sales Co., National Electrical Products Co., Neptune Water Meter Co., Select Lingerie Co., Sims, Till Mfg. Co., Ltd., Sunbeam Chemical Co., of Canada, Limited, Taylor Instrument Co., Veterans' Mfg. Supply Co., Ltd., Ward Baking Co., Wolverine Limited. Firms located on harbor properties are: Anthracite Briquette Co., Baldwin Canadian Steel Corporation, Barrett Co., Ltd., Canadian Ice Machinery Co., Coleman Lamp Co., E. Fielding & Sons, Fish Coal Co., Nukol Co., Ltd., Ontario Oakoal Co., Peckover, Ltd., Wm. F. Sparling Co., Toronto Structural Steel Co.

MARINE

Owen Sound.—Mr. Angus A. Cameron, chief engineer of the C. P. R. steamship fleet, was in Owen Sound looking after new steam winches which are being made there by the Wm. Kennedy & Sons Co. These winches are for mooring purposes and will be placed aboard the three older steamers—the Manitoba, Alberta and Athabasca—during the winter. The new equipment will result in a big improvement in handling these boats.

The Mead Morrison Mfg. Co., East Boston, manufacturers of hoisting and conveying machinery, have purchased the plant of M. Beatty & Son, at Welland, Canada. The Canadian plant occupies about nine acres of land and heretofore has been engaged in the manufacture of hoisting and dredging machinery. It will be operated by the Boston company as a Canadian branch and such alterations and additions will be made as are required to adapt it to the new work.

APPOINTED MANAGER OF VICTOR SAW WORKS

F. J. Macdonell has been appointed manager of the Victor Saw Works of Hamilton, Ont., in place of H. W. Holmes, who recently resigned. Mr.

F. J. MACDONELL,
Manager Victor Saw Works.

Macdonell intends covering the Maritime Provinces and Western Canada. J. A. Evans, who has acted as office manager for the firm for the past seven years, has now joined the sales force and will look after the Province of Ontario.

STEEL CO. OF CANADA HOLDS CONFERENCE

Salesmen From All Over the Dominion Attend the Gathering at Hamilton

More than 100 representatives from all parts of the Dominion attended the eighth annual sales conference of the Steel Company of Canada, Limited, held for four days at the Royal Connaught Hotel, in Hamilton. Owing to the unavoidable absence of President Robert Hobson, the representatives were welcomed by Vice-President Cyrus A. Birge and Charles S. Wilcox, chairman of the board.

A feature of the general discussions that took place was the opinion expressed unanimously by various speakers that 1920 will offer splendid opportunities for business. One of the difficulties, it was stated, is going to be to get production owing to scarcity of raw materials. The opinion was freely expressed that this condition is likely to prevail throughout the entire year.

The business sessions on Tuesday, Wednesday, Thursday and Friday were in charge of George Spence, Western sales manager; H. T. Diplock, of Montreal, the Eastern sales manager, assisted by George A. Simpson, C. E. Harrison and Thomas Moore, of Hamilton, and D. J. Black, of Montreal.

On Tuesday evening a banquet was tendered the visitors. On Wednesday evening a dance was given to the office employees and more than 150 couples spent a most enjoyable evening. On Thursday evening a theatre party was held and on Friday visits were made, both to the Hamilton works and the Canada works.

BRANTFORD ROOFING PLAN NEW EXTENSIONS

Outlay For New Additions This Season Will Amount to Some $50,000

THE Brantford Roofing Co., Ltd., of Brantford, Ont., are entering into improvements on quite a large scale. They are erecting a new boiler and engine room of concrete construction, with brick walls, measuring 30 by 40 feet. In this building will be installed a new 66 in. x 14 ft. return tubular boiler, together with necessary pumps, etc., etc.

They are also erecting a new coating tank room of concrete construction. This building will be 36 ft. x 50 ft., and have a 60 ft. brick stack. Four boiler tanks will be installed in this portion of the plant.

The concrete storage bin will be 18 ft. x 80 ft., so arranged that a 20-inch belt conveyor will take the material to its proper source. The handling capacity of this conveyor in its entirety will be 40 tons per hr.

Schultz Bros., of Brantford, are handling all the work on these buildings, while J. H. Hall & Sons, Brantford; Waterous Engine Works, Brantford; Guyton & Cumfer, Chicago, and the Jeffreys Mfg. Co., Montreal, are supplying the necessary machinery.

Taking the whole thing into consideration, the machinery and buildings will cost around $50,000.

PERSONAL

A. A. Roelofs, formerly special representative of the Precision & Thread Grinder Mfg. Co. in the Ohio territory, has been advanced to manager of the Chicago office.

J. B. Smythe has resigned as superintendent of A. O. Norton, Limited, Coaticook, Que., which he has held for 12 years, and will take a short vacation before resuming in some other line.

D. G. Anderson has moved to Pembroke from Ottawa to take over the management of the Steel Equipment Co. factory. Up to the present Mr. D. P. Cruikshank has been in charge, making trips from Ottawa for several days each week to look after affairs, but hereafter he will give more time to the sales end of the business.

Plant of

THE JOHN MORROW SCREW & NUT CO., LIMITED

AT INGERSOLL

Where the famous Morrow High Speed Drills are manufactured. This is the pioneer plant to produce Twist Drills in Canada.

Every user in Canada who wants "production" **(More holes with less regrinding),** should use these Drills. There's a difference your operator will tell you of with satisfaction. Every Morrow Drill is guaranteed. Each tool gives **you** the proper service you should get **and more.** Order **now.**

Also manufacturers of Set Screws, Cap Screws, Semi-finished Nuts. Sole distributors of P/H and Imperial Brand Files. "They cut faster and wear longer."

Works at

INGERSOLL, CANADA

The Week's Events in Montreal Industry

The Davey Machine and Repair Company, 1227 Ontario St. East, Montreal, are now making the Davey patented tool holders.

Furniss, Clarke & Co., 364 University St., Montreal, has taken on the lines of the Talbot-Stead Tube Company Ltd., of Birchills, Walsall, Eng.

W. M. Neal, who has been general secretary of the Canadian Railway Board, now the Railway Association of Canada, has been appointed to the position of assistant general superintendent of the Quebec division of the Canadian Pacific Railway.

The Montreal plant of the National Electro Products Company, on Morreau Street, has just been completed. The company has been making exhaustive tests during the past few weeks and are now manufacturing commercial oxygen and hydrogen for the trade

The first instalment of machinery and power equipment that will be used in connection with the new plant of the St. John Dry Dock and Shipbuilding Company, at Courtenay Bay, has been delivered to the site. This shipment consists of four carloads and will form part of the twenty carloads that will be required to fit out the plant. The machinery, when unloaded, will be stored in an adjoining warehouse until the buildings are ready to receive it.

As a direct result of the greatly increased business that has been steadily piling up with Great Britain and many of the British colonies distributed throughout the world, the executives of the Gillette Safety Razor Company of Canada, at their annual meeting held last week, have decided to extend their present manufacturing facilities, and to this end have purchased adjoining property to the Montreal factory that will provide an extra 13,000 square feet of floor area. While temporary use of this property will provide for immediate needs, further expansion is contemplated.

At the luncheon given by the Engineering Institute of Canada on the first day of the convention, a discussion on the growing necessity of new methods in the construction and maintenance of highways was a feature of the session. It was suggested that some federal system of co-ordination be adopted to build roads on regular plans throughout their length so as to adequately meet the requirements of modern motor traffic. The rapid extension of motor traffic made it imperative that a standard road should be maintained on the main highways, and that everything should be done to encourage some co-operative plan of permanent and uniform roadways.

At the annual meeting of the Montreal Board of Trade held last week a resolution was passed endorsing the action of the council in their efforts to have the Government to remove the present Business Profits' War Tax. It is the opinion of the members of the board that the present tax is detrimental to the development of the country, and that if such revenue is still necessary the same should be derived by some more general method of taxation. Another feature of the business of the meeting was the unanimous endorsation of any action that would promote closer trade relations with the British West Indies. The officers for the ensuing year will be George Sumner, president; Hon. Lorne C. Webster, vice-president; Arthur Lyman, treasurer; and Stanley Cook secretary.

CANADIAN RAILWAY CLUB HOLD MERRY TIME AT ANNUAL DINNER

THE seventeenth annual dinner of the Canadian Railway Club was held on the last night of January, at the Windsor Hotel, Montreal. About 300 were present at the tables and all did justice to the food (and drink) placed before them. The dinner was presided over by J. Hendry, president of the club, with Lewis C. Ord as toastmaster. The Hon. Arthur Meighen and Rev. George Adam were the guests, and with them at the head table were: W. M. Neal, late secretary of the Canadian Railway Board; W. H. Winterrowd, H. H. Vaughan, J. M. S. Carroll, R. M. Hannaford, Jas. Coleman, W. H. Sample, T. C. Hudson, W. McNab, A. A. Goodchild, W. A. Booth, A. A. Maver, Wm. H. Robb, W. A. Kingsland, Norman Holland, and G. M. Wilson.

In proposing the toast to "Our Railways," W. H. Winterrowd gave a brief resume on the history of railroad development in Canada from the time that the first train was put in operation 92 years ago, up to the present time, particularly emphasizing the effective special service rendered by the railroads during the past five years. The reply to this toast was ably given by W. M. Neal, formerly general secretary of the Canadian Railway War Board, and recently appointed as assistant general superintendent of the Quebec district of Canadian Pacific. His brief address was largely taken up by a review of the achievements of the Board in getting the effective co-operation of the various railroads under the auspices of the C.R.W.B., whereby there had been great saving in labor and operating costs. Mr. Neal gave numerous figures to illustrate his remarks.

The toast to "Our Guests," which was proposed by T. C. Hudson, was responded to by the two chief speakers of the evening, the Hon. Arthur Meighen, Minister of the Interior, and Rev. George Adam. In his address, Hon. Arthur Meighen spoke on the gradual, but progressive, development of Canadian railroads, and defended the policy of the Government in their acquisition and control of additional mileage. He emphasized the changing industrial conditions that were virtually forcing the Government to take over the Grand Trunk. In speaking on this matter he said: "I pass the subject up only with the statement that that acquisition, like the previous one, was not brought about through any restless ambition to become great railway operators and owners, but it was the result of our railway crisis, the result of some mistakes and, indeed, of the very evolution of railroads. But a country that has contributed 640,000 men in the great struggle for liberty that has ended in triumph does not need to quail before the task of managing thousands of miles of railway even under a Government system."

The short reply by Rev. Geo. Adam was appropriately humorous in character, but with a human touch that went direct to the hearts of the entire audience. He dwelt on the factor of distribution of wealth and the direct bearing it had upon the life of a nation, the strength of which was a question of happy and contented homes rather than the taxable value of the country's wealth. In closing, the speaker said: "There is also a need for the distribution of ideas. Every child of rich and poor should have the same right to receive from the distribution of ideas through the medium of education. The only hope of Canada's future greatness lay in the distribution of her ideas on a larger scale than ever before."

The toast to the "Railway Supply Men" was proposed by W. H. Sample and replied to by H. H. Vaughan of the Dominion Copper Products, and J. M. S. Carroll, sales manager of the Canadian Consolidated Rubber Company.

Interspersed with the food and drink for the physical and the intellectual man, the entertainment committee had provided an excellent program that appealed particularly to the eye and the ear. Several of the leading artists from local theatres were engaged to relieve the pressure that had gathered from a year's sojourn with railroad and other problems.

ARE PLANNING TO ASK FOR AN INCREASE OF BRITISH PREFERENCE

AT the annual meeting of the Canadian Association of British Manufacturers and their representatives, which took place at the Walker House on January 28, a lively discussion arose as to the future attitude of the association towards representatives or agents who may enter into any agency agreement with manufacturers or wholesale exporters whose principal works or places of business are situated in a country which was hostile to Britain during the war. The debate had its origin in a suggestion made that a clause of the constitution, prohibiting representatives of British manufacturers having similar connections with firms of or in former enemy countries from membership in the association, should be deleted. After many arguments had been advanced it was resolved to submit the proposed alteration in the constitution to a "postal vote."

GEORGE A. MARSHALL,

President of the Canadian Association of British Manufacturers. Mr. Marshall is a partner in the firm of Marshall, Son & Bunney; president of the Kerr File & Tool Co., Ltd., and proprietor of the Perfection Sanitary Brush Co.

Mr. John Wilson, the retiring president, in his address made an announcement which was well received, to the effect that an arrangement had been reached with the Federation of British Industries by which commercial intelligence could be exchanged between members of the Canadian Association and the British manufacturers. The Federation of British Industries, Mr. Wilson stated, had a membership of over 19,000 firms representing $20,000,000,000 of capital engaged in British industries. It would now act as the London representative of the members of the association, which, he declared, now number 85, representing about 400 British manufacturers. The London office of the F. B. I., situated at 39 St. James' street, London, S. W. I., would now be available for members of the association visiting in London as a means of getting in touch with such members of the Federation as they might wish to see.

Want Preference Increased

With regard to tariff matters Mr. Wilson said that the association was in close communication with the Minister of Finance with a view to increasing the British preference on such items as iron and steel, paints with spirit base, fire brick and other clay products, etc. He invited the members to submit all their tariff difficulties to the Executive Council, so that it might present them to the proper authorities, as the Dominion Government had agreed to receive a deputation from the association when the proposed tariff investigation is held. The Executive Council had also, he said, passed a resolution requesting that the Department of Overseas Trade of the British Government take immediate steps to appoint the necessary inspectors in Great Britain in order that the certificates required by the Canadian Government in respect to imports of potted meats might be forthcoming for shipment to Canada from British firms.

The election of officers for 1920 resulted as follows: President, Mr. G. A. Marshall; vice-president, Mr. J. Harris; council, Messrs. A. C. King, C. W. Beal, James Haywood, R. D. Harding and Harold A. Wilson.

CANADIAN MACHINERY MEN SHOULD GET IN TOUCH WITH CUBAN BUYERS

A SUBSCRIBER of CANADIAN MACHINERY in Havana, Cuba, writes to this paper as follows:

I was very glad to see in my office down here several copies of CANADIAN MACHINERY AND MANUFACTURING NEWS, and I have given some of our old copies away to people who are interested in buying machinery from Canada.

I am writing you in the hope that you may be able to interest Canadian machinery people in the Cuban market. At the present time there is a very heavy demand for locomotives, new and rebuilt; rails, 60 and 75 lb., inspected, complete, with splice bars and bolts; galvanized barbed wire, 6 in., 12 gauge, 4 points to a barb; and many other odd lines. A prominent British machinery house (Albert Maloney, of 12 Amargura street, Havana), enquired for the above.

I am enclosing a list of prominent machinery dealers in Havana. Any Canadian firms who have machinery for sale might write direct to any of these firms, or let the trade commissioner here know at once what they have for sale and he could put the enquiry in the hands of some firm here who requires that article. As you probably know, the Canadian Government Merchant Marine has inaugurated a very good direct service from Halifax and St. John to Havana.

Canadian exporters to Cuba must always bear in mind that United States goods enter Cuba with the advantage of 10 to 40 per cent. reduction of the general tariff rates, with the exception of the following goods on the free list: Natural fertilizers, agricultural hand tools, ploughs, hemp, flax, jute, coal and coke, bricks, barbed fencing wire, newsprint and wood pulp.

MACHINERY MANUFACTURERS
Continued from page 112

I would be pleased if you would do your best to interest Canadian machinery houses in the Cuban market.

Here is a list of the principal machinery importers of Havana, Cuba:

Hijos De H. Alexander, Lonja de Comercio, 10 Piso.

J. F. Berndes & Co., Cuba 64.

Casacarter, S. A. (agricultural), Obrapia 61.

Oscar B. Cintas, Oficios 29-31.

Cuban Machinery and Supply Co., Obrapia 32.

R. J. De Orn & Co., Conacha y Marina.

Ellis Bros., Inc., Cuba y Lamparilla.

Gaston, Cuervo & Co., Habana 94.

General Machinery and Trading Co., Cuba 58.

Havana Marine Railways, Inc., San Pedro 2, Altos.

Jimenez, Rojo y Padro, O'Reilly 5.

V. V. Lebedjeff Engineering & Supply Co., Cuba 27.

Lombard & Co., O'Reilly 9½.

Machin & Wall Co., Ricla 8.

Victor G. Mendoza & Co., Cuba 3.

Albert Maloney, Amargura 12.

Quinones Hardware Corporation, Aguiar y Empedrado.

Thrall Electric Co. (electrical), Monserrate y Neptuno.

U. S. and Cuban Allied Works Engineering Corporation, Cuba 51.

Jose L. Villamil, Santa Clara 5.

Zaldo & Martinez (electrical), O'Reilly 26.

Zayas Abreu Commercial Co., San Ignacio y O'Reilly.

P.S.—It might be of interest to mention that the Canadian Trade Commissioner here is H. A. Chisholm, Teniente Rey 11, Rooms 501 and 502.

SALES CONVENTION OF CANADA METAL

The ninth annual sales convention of the Canada Metal Co. was held at Toronto during the week of January 19th, forty-five of the salesmen being present for the occasion. Mr. Harris, Sr., president of the company, gave an address of welcome to the representatives and then turned the meetings over to Mr. Harris, Jr., who pointed out the value that could come from a sales conference if all co-operated. Monday evening, the entire staff had dinner at the Queen's, Mr. Harris, Jr., on this occasion taking the opportunity of presenting everyone with a life insurance policy to mark the company's appreciation of the largest year's business in its history. During the conference in the following days, trips of inspection were made to some of the large newspaper offices where the company's metal is in use, and also to the John Inglis Co. plant, where they could see the use to which the firm's babbitt is put in marine engines.

In the sales competition, the prizes went to Mr. L. J. Martin and Mr. Willis. Mr. White, from the Western field, won a special prize of a $150 gold watch. Mr. Garrett, also a Westerner, was second to Mr. White in this particular competition.

The making of nails at the Harris plant was also witnessed by the salesmen. Nails, varying in size from ⅜ in. up to 8 ins., were made on the different machines. At present the output of the nail department is 50 tons every 24 hours.

An event of rather an historic nature, particularly to the citizens of the City of Montreal, took place on the evening of January 30, when the new home of the Mechanics' Institute was officially opened. In his speech, Sir Alexander Bertram, the principal speaker, remarked on the worth of the mechanic in the community, stating that his life was one of accomplishment and production, and enumerated many of the wheels of progress created and kept going by the brain and hand of the skilled workman. In reviewing the development of the institute, W. Rutherford, the president, stated that the organization was first founded 92 years ago, but that the work was temporarily interfered with at the time of the rebellion of 1837. A Government charter was received in 1845 and a permanent home secured ten years later at the corner of St. Peter and St. James Streets, which location has been its home for the past 64 years. The new building on Atwater Avenue is ideal in every respect, and nothing has been overlooked in providing maximum comfort and convenience for the mechanical student and reader.

The most successful annual gathering in the history of the Engineering Institute of Canada was held last week at the Windsor Hotel, Montreal. The membership registration for the three days was over 650, and these were from all sections of both the United States and Canada. The feature of the business meetings was the reading of many engineering papers, and emphasis was laid on the essential need of special training in the different branches of engineering activities. At the dance held on Tuesday night over 400 guests were present, music being rendered by the Great War Veterans' Orchestra. At the smoking concert given on Thursday evening an excellent programme was given by a number of artists from local theatres. The officers for the year are Commissioner R. A. Ross, Montreal, president; Brig-Gen. C. H. Mitchell, Dean of the Faculty of Applied Science at the University of Toronto, and W. G. Chace, Winnipeg, vice-presidents.

Mr. F. Rodger Imhoff, New England representative of the Precision and Thread Grinder Manufacturing Company, has recently been made Field Engineer.

He will make his headquarters in Detroit, and cover the entire country in the interests of the Multi-Graduated Precision Grinder.

Mr. Imhoff is an expert in thread grinding, and has written many interesting papers on that subject.

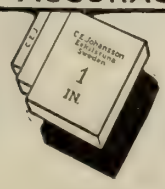
"The Millionth of an Inch"

C. E. Johansson

This illustration shows the only set of gages ever made with divisions to the millionth part of an inch. About 3000 hours' work of several of the most skilful gage-makers in the world were required to produce it. The variations do not exceed two ten-millionths of an inch. C. E. Johansson says:

"When I first made gages with divisions to the ten thousandth part of an inch, manufacturers said they were wonderful but that they didn't have to work so close. But after a while, they found it well to adopt my standards and then later the gage-makers found that they required still finer set to check up ten-thousandths and so I made sets with divisions to the hundred thousandth part of an inch. Then when I read in the American magazines that some were now talking of the millionth of an inch, I thought I would produce a little set in millionths, and so I further improved my measuring methods so that I could measure to the ten-millionth part of an inch.



"I do not offer this set as a practical mechanical tool but as an example of what can be done and as something that large laboratories and bureaus of standards can use."

ACCURACY

STERLING
HACK SAWS

Are known the world over for their efficient cutting quality which insures economy and satisfaction.

You will make no mistake in buying "Sterling" Blades for the following reasons.

1st—They are made of the very best quality of steel rolled by any mill in the world.

2nd—The best mechanical construction which has been acquired by many years of experience.

3rd—Special heat treatment which goes to make the efficiency both for maximum quality and uniformity.

A trial will convince you.

Tiresome, Expensive, Dangerous, Wasteful—but Unnecessary.

With Bowser Equipment One Man Does the Work with Less Time and Effort —and Without Loss

STOP WASTING LABOR IN HANDLING OILS

Do away with the back-breaking, disagreeable labor in storing and handling oils.

With Bowser Storage Equipment the heavy work is done mechanically—there is no wasted energy—all oils are easily and quickly put into storage by gravity.

Save With BOWSER Systems

Distribution is done by accurate, rapid self-measuring pumps—no oils are left in shipping containers to dry up, leak and seep away—none is lost through spilling or dripping faucets. Every operation in the use of oils is done in a systematic, safe and saving manner.

Write us for literature, showing why Bowser Systems are a paying investment

Watching the development of more Serviceable milling machines?

YOU must take advantage of up-to-the-minute machine tools to produce at a profit. New features are always to be looked for in Garvin Milling Machines first. Garvin engineers have led the way from the beginning.

The Garvin 2A Universal Miller —an ideal for all-around service —has many points of distinction. Power feed, with reverse and automatic trip, is provided in all directions, table, in and out, up and down. The power feed movements are all controlled by one handle. The table is wide and proportionately deep. It can be swiveled clear around in line with the spindle.

Convenience aids largely in producing at greater speed. For instance, when the knee is in its lowest position the operating handles are still all in handy reach. No awkward stooping is called for.

The solid, closed top knee with extended bearing on the column, square ways for saddle and guide fit, taper gib central over in and out screw—these features are characteristic of all modern Garvin Millers. Note also that the feed screw is telescope—no holes through the floor.

These are but a few of the distinguishing marks of the mechanical excellence of the entire and varied line of Garvin Millers. You are not ready to make a final choice of a milling machine until you have seen the 340-page Garvin Catalogue.

Protect your small motors with—

CONDIT

Type I Oil Starters

Safety

All mechanism and live parts are entirely enclosed — fuses are dead when switch is in open position — may be locked in open position. This means absolute safety.

Motor Protection

Starters are of **Oil switch construction,** equipped with enclosed fuses for overload and short circuit protection.

Special design enables fuses of approximately full load running current to be used, **which will not blow during starting period.**

It is equipped with low voltage release which immediately disconnects the motor on power interruption or any considerable drop in voltage.

Handle cannot be left in starting position.

Installation and Maintenance

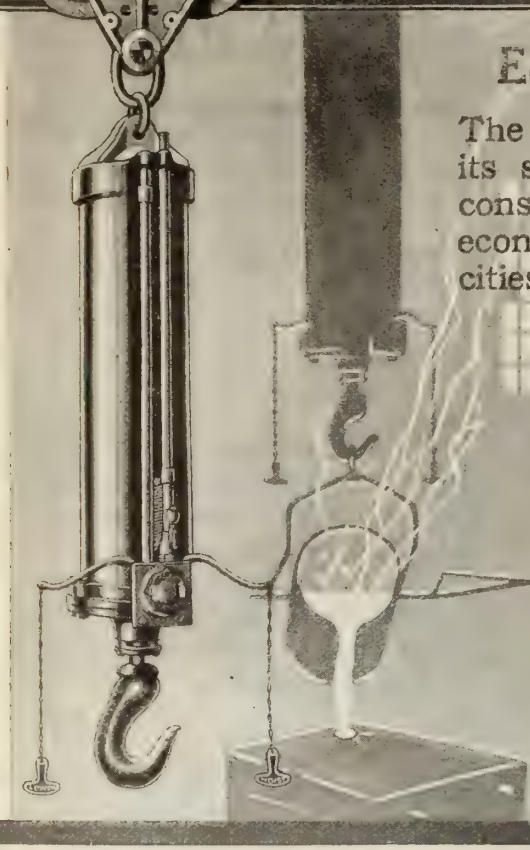
The Conduit Type I Motor Starter is compact and easily mounted on any flat surface.

It is equipped with interchangeable knock-out plates arranged to receive 1½", 1", ¾" or ½" Conduit.

Both movable and stationary members are identical, interchangeable and reversible, reducing maintenance work to a minimum.

The liberal design of conducting parts insures long life.

Ample space in the case for making connections.



Our nearest house can supply you.

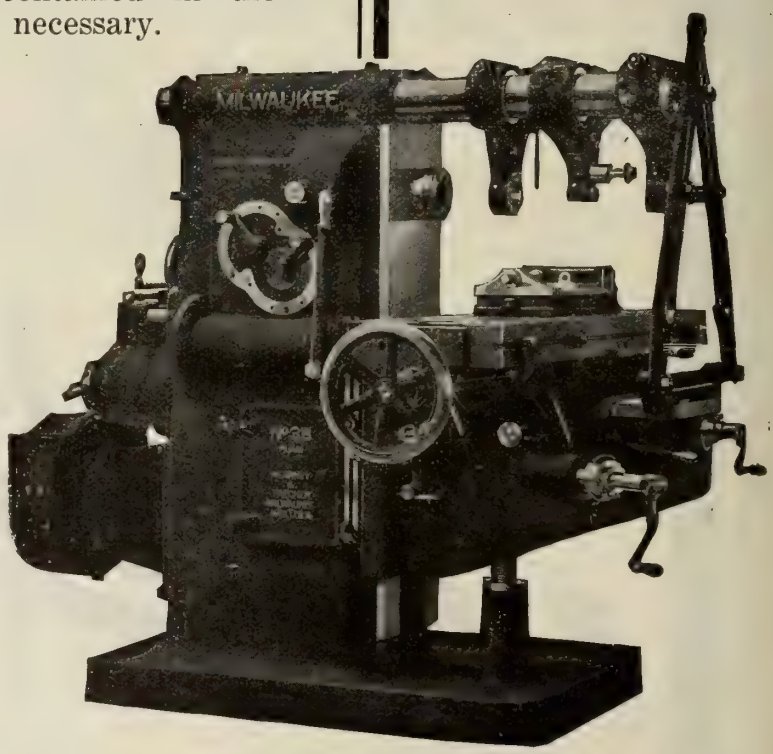
Milwaukee Milling Machines

Increase Production on a Low Upkeep

BECAUSE of the numerous meritorious features that Milwaukee Milling Machines embody, increased production on a low upkeep is obtained. They accomplish most accurate results and are easily operated, due to the convenient location of all levers and handles.



The column is a one-piece, box section casting with few and small openings, reinforced with heavy vertical and horizontal internal walls. The base is made pan-shaped to catch splashing oil and chips.

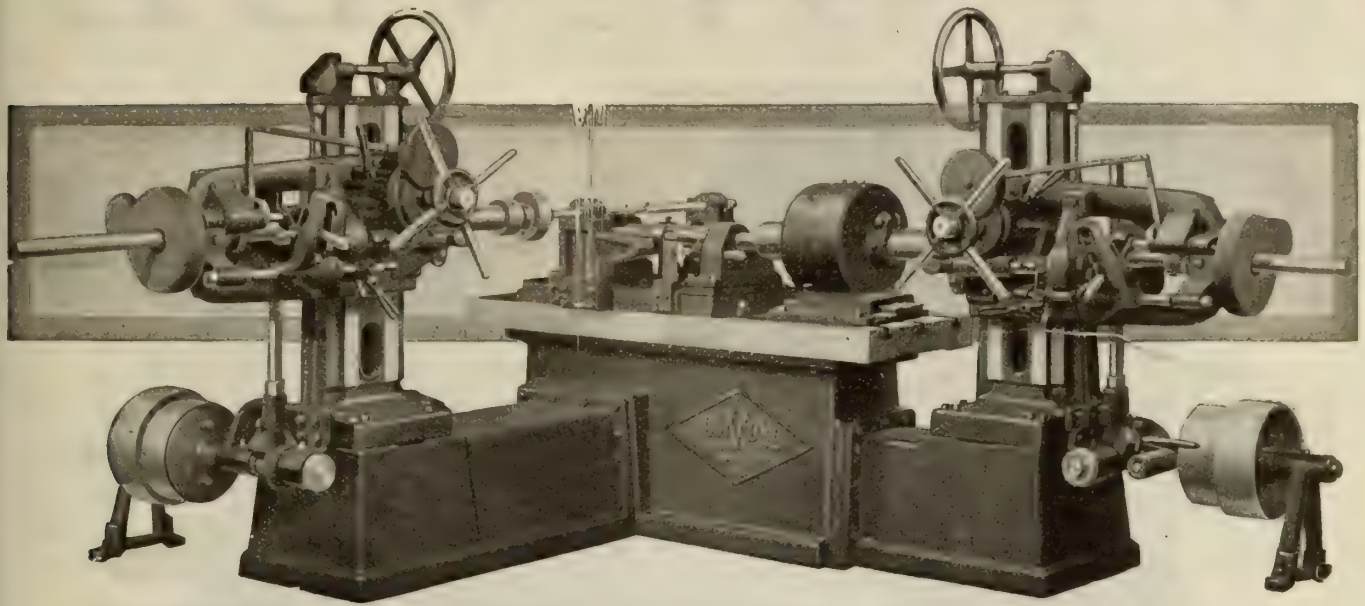
The double overarm provides for positive alignment of the arbor and prevents it from being pounded out of line when using large, coarse pitch cutters on rough, heavy work. This makes it possible to use cutters at a greater distance from the face of the column.

The spindle has a large flange forged on the end. This flange carries keys for driving large face milling cutters, that are attached directly to the flanged end by means of four bolts, and also for driving the hardened steel arbor drive collar. The arbor drive collar protects the end of the spindle from injury, so that when face milling cutters are attached they run true. The reverse for the spindle is self-contained in the machine; no overhead apparatus is necessary.

All gears and bearings in the column, feed box and pulley bracket are automatically flooded with lubricant that is pumped to the top of the machine and distributed by a perforated pipe. This pump operates whenever the drive pulley rotates.

Every Milwaukee Milling Machine is equipped with a cutter lubricating system which is an integral part of the machine and is not added as a separate item. The cutter lubricating system operates only when the spindle is running.

Complete facts, regarding Milwaukee Milling Machines, will be found in our catalogue. Write for a copy, TO-DAY.



KEARNEY & TRECKER CO., MILWAUKEE, WIS., U.S.A.

Rockford Horizontal Boring Machine

For Automobile Manufacture

This tool is unusually rapid and accurate in the boring of crank cases, transmission cases and rear axles. Has two heads at right angles to each other. Spindles bore longitudinal and cross holes in work simultaneously.

Send us blue prints of your boring work and we will give you figures on the "Rockford's" ability on it.

MODERN
Plain Grinding Machines

Something to think hard about

A FEW THOUGHTS FOR SHOP EXECUTIVES WHO THINK IN TERMS OF EFFICIENCY AND SATISFACTION

WHY MORE THAN 700 MODERN GRINDERS ARE IN USE IN ONE FACTORY

Eight years ago one Modern grinder was installed in a certain factory that its capabilities might be compared with then better known makes.

In August and September last, we advertised the fact that this particular factory had in daily use "more than 500 Modern Grinders."

Shortly thereafter began a constant stream of orders for Modern Grinders—proving conclusively that Modern was best of all.

To-day in that factory there are more than 700 Modern Grinders of all types manufactured by us.

WHY? **The answer is short but tells a lot to executives who analyze and think. There are just two reasons: Perfect satisfaction is one. Superiority over all others is second.**

What about your own Grinding Problems? Moderns will satisfy you, too.

We're "Bulls" *on* Canada

PROSPERITY, rising stock values and a vast amount of "Loose" money,—all these have led to the biggest year of speculation Canada has known—1919. The trading in Montreal exceeded all previous records, and "Everybody's doing it." Stenographers and bank messengers are making a few dollars; financiers and plungers are making their millions. And, don't you forget it, many are losing, too.

In this leading article in the February 1st MACLEAN'S the mania for "taking a chance" is discussed and R. Laird Briscoe tells why there are not many losers—yet. Two men have made $6,600,000—this article tells how simply it's done. One typist bought a $2000 car with a $100 bill. It's really very simple when you know how—**IF** you guess right.

J. K. Munro Says:

THERE will be an election before Fall—it's among the probabilities. Sir Robert Borden took the Premiership with him to South Africa. What will he do with it when he returns? Why didn't he nominate a successor before he left? Why could Sir Thomas White have the job if he wanted it, and why wouldn't he make a good leader to go to the country?

These and other questions are discussed and answered in Mr. Munro's snappy, vigorous, pithy style.

Balking the Bolsheviks

A CANADIAN woman had some extraordinary adventures in Roumania with the Bolsheviks. She is Mme. Pantazzi, and was Miss Ethel Greening, of Toronto. She tells how she and her husband escaped death's door by the narrowest of margins—not once but several times. Incidentally, she tells more of the wonderful adventures of that Admirable Crichton of cosmopolitan free-lances, "Klondyke" Boyle—also Canadian as MacLean's readers know.

Flaherty of Belcher Island

THIS is where the natives wear duck feather kimonas, in a part of Canada which even the geologists and explorers didn't know existed until a few years ago. Of course, you would expect the discoverer to be an Irishman—and in February 1 MACLEAN'S you can read how Flaherty found his island, and what he discovered there—the richest iron ore deposit in the world, but—can it be transported to market?

Other Features are:

"Breed," by Archie P. McKishnie.
"The Thread of Flame," the Basil King serial.
"His Majesty's Well-Beloved," the concluding instalment of the Orczy serial.
"Canada Has a Movie Future," by Allan Dwan.
"Spanish Doubloons," more of Camilla Kenyon's rollicking adventure story.
"Mr. Phipps of the 'Old Firm'," by A. Appleby Terrill.

MACLEAN'S is issued Twice-A-Month

starting with this issue. An important point to remember. If you want to keep up with things **nationally Canadian,** you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 350,000 Canadians Read

MALLEABLE AND CAST IRON PIPE FITTINGS

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince.

H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

THE CHAIN CAN'T JUMP THE FLANGE

Equipped with a patented Loop (Hand) Chain Guide which encircles the lower half of the flanged wheel and prevents "gagging" or overriding the flange.

Thus a FORD TRIBLOC can be operated from any angle, at any speed, without danger of breakage or delay.

Enclosed steel planetary gears and carefully tested chain spell safety and durability.

A FORD TRIBLOC booklet tells the chain hoist story in an interesting way. Send us your address and we'll give you a copy.

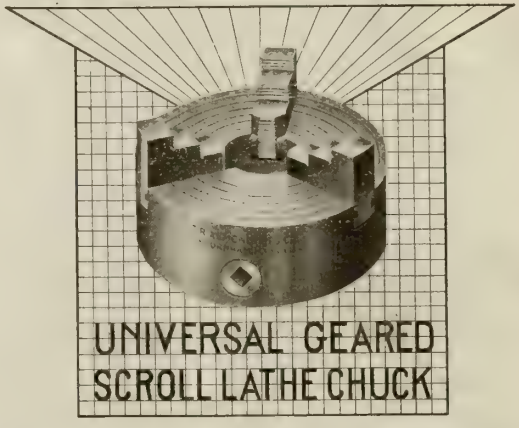
ALL STEEL

INDEPENDENT CHUCKS

are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.

THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.



UNION MANUFACTURING COMPANY

New Britain, Conn.

***New York Office:* 26 Cortlandt Street**

Makers of a complete line of chucks

ALMOND

The body is a one-piece casting which eliminates parts and chattering when under heavy cutting pressure. The jaws are made of special alloy steel and hardened through making them stronger than the usual case hardened jaws. Two styles jaws—No. 1 Common Jaws, No. 2 Reverse Jaws.

OTHER ALMOND PRODUCTS

Drill Chucks, Right Angle Transmission Micrometer Calipers, Flexible Steel Tubing.

Continued Operation

Broken drills with subsequent loss of time and temper never occur when the drill is gripped by the jaws of the Jacobs Improved Drill Chuck.

A turn of the key, a one-hand operation, locks or unlocks the drill.

Jacobs Improved Drill Chucks run smoothly, positively.

They align the drill accurately, they drive the drill with certain force and get precise borings.

All hardware dealers and equipment houses carry Jacobs Improved Drill Chucks in the six different models and twelve styles, ranging from 13/64″ to 1″.

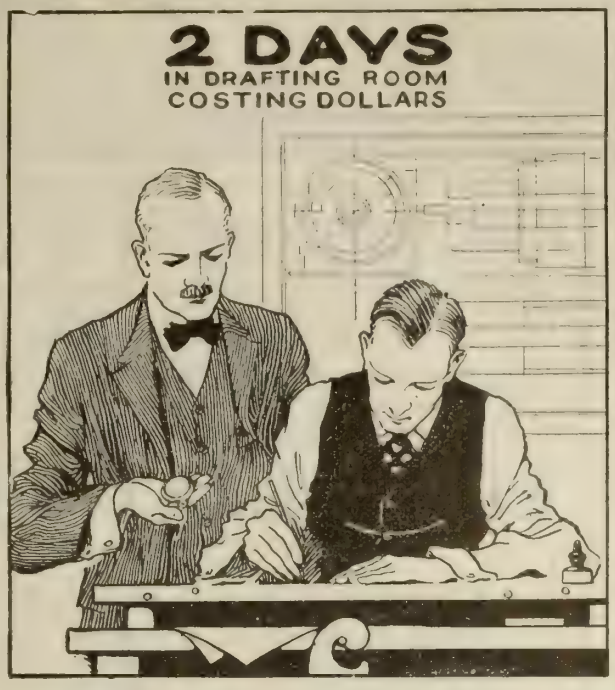
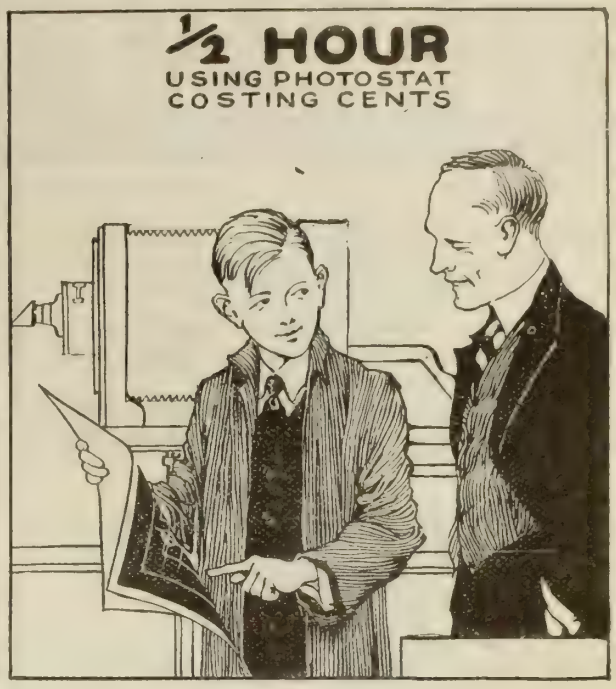
From the RAW ABRASIVE to the PERFECT WHEEL

DOMINION Grinding Wheels are positively equal to the best imported wheels. Let us tell you why!
Canadian wheel manufacturers mostly depend on the open market for raw materials. As a result these materials vary in quality—naturally the wheels varied in quality, too. We now have our own abrasive plant. We are thus assured of our quality of abrasives—quality that is always uniform—and it follows that DOMINION Wheels can always be depended upon.



Try a DOMINION Wheel on a QUALITY basis. Put it to a hard test and watch results.



Dominion Abrasive Wheel Co., Limited
MIMICO, ONT.

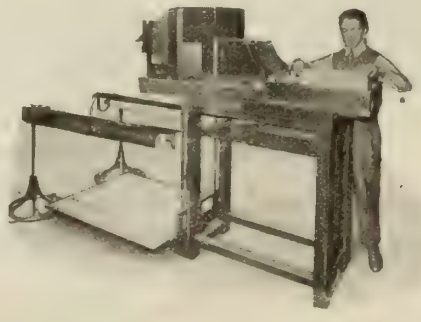
Which? In Your Business?

Your customer sends you a blueprint for that new contract that you have just closed. You must have several copies for the shop. You can't make blueprints from a blueprint and to have a tracing made you must wait anywhere from two hours to two days, or possibly longer if the drafting room isn't able to start work at once. Then there is always the possibility of an error in the tracing when it is finished. It is discouraging, isn't it, when you've quoted that customer an "inside" delivery to get started with him?

And the chief draftsman isn't any more pleased than you, because he probably has to take an expensive man from a creative job and put him on an unproductive copying job.

But wait—there is a way out of your difficulties. It's the

PHOTOSTAT



Trade Mark Registered

This machine will give a clear, clean, photographic copy of your blueprint, in a few minutes and without the use of expensive negatives or a dark room. Just think, in this short time it will deliver to you, ready for use, all the facsimile copies you need—and at a cost of only a few cents apiece. Also remember that the PHOTOSTAT

MAKES NO MISTAKES

Ask for our catalog giving complete details

The PHOTOSTAT quickly pays for itself not only because it copies blueprints, but because it copies pencil sketches and drawings, tracings, maps, plans, pages from books, advertising layouts, photographs, small tools and machine parts, production schedules, etc., at **original size, enlarged** or **reduced** within the limitations of the apparatus.

Times Have Changed

The burden of manufacture has to be borne by proper time-saving, dependable, productive tools. Putting off the issue will not help. Now is the time. Mark these words down where you will see them.

The Rochester Helve Hammer
Quick Change Stroke

Long or short, fast or slow, heavy or light—any length, weight and force of blow instantly secured on the Rochester "Helve" while the machine is running. This feature alone saves so much time where there is a variety of small work to be forged, swaged or welded, that it recommends the tool without reference to its other distinctive features. Made in 6 sizes, 2 styles of frames, 25-lb. to 100-lb. heads. For Welding and General Forging the "Rochester" is peerless in efficiency. Full description in catalog.

Ask for the Rochester Helve Hammer Book.

ECONOMIZER FURNACES IN CANADA

Canadian manufacturers choose **Rockwell Economizer Furnaces** not because they are produced in the U.S.A., but because they produce for Canada.

A good article knows no boundaries, and these **Rockwell Economizer Furnaces** will continue to be the choice of discriminating buyers everywhere because they assure:

Saving of fuel. Protection of the operator. Greater output. Use of one system of piping. Less heating area. Reduction in quantity of scale. Cleaner shops.

One Handle Controls the Feed

The distinctive features that give Brown & Sharpe Wire Feed Screw Machines such great flexibility are the Roller Feed and the Automatic Chuck.

The Roller Feed is located in a case near the front spindle bearing. This brings the feed rolls very close to the chuck so that each bar is used practically to the end.

The rollers feed any length without adjustment and will take stock of any shape or any size within the machine capacity. There is only one pair of rollers which are quickly and accurately adjusted.

The chuck used in connection with the roller feed is equally simple.

It is adjustable to all shapes of stock without changing the jaws and takes all sizes within the machine capacity automatically compensating for slight variations in the bar. These improvements will be appreciated as they obviate the necessity of a large stock of expensive collets. The adjustment for different sizes is easily and quickly made, the jaws being set with a wrench in the same manner as those of a universal chuck and when adjusted they can be clamped to hold the size.

These features are of special importance since they eliminate a supply of changeable parts for feeding different sizes and shapes of stock.

The chuck and roller feed are operated in conjunction by a single lever on the front of the headstock.

Catalog 22G describes the entire line in detail; your inquiry will receive prompt attention.

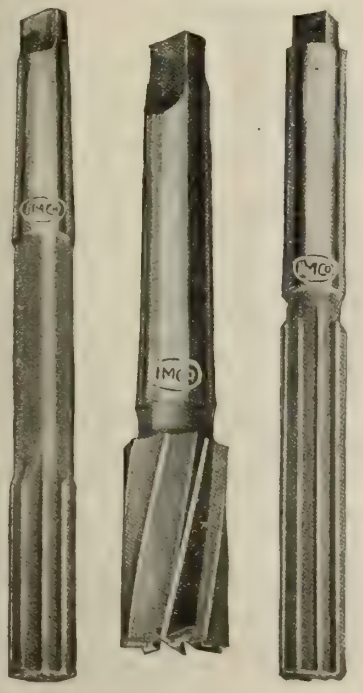
"IMCO" Tools



Service
—*is proof of merit*

Not careful workmanship alone, nor perfect finish, nor even a great many years' manufacturing experience. Service is the *only* proof—the acid test of the small tool.

In service, as in any other particular, Imco tools may be favorably compared with any on the market.

Imco tools have rapidly established a splendid reputation for endurance, for reliability, for the faculty of cutting keenly and accurately after hard use—in short, for economy.

For the real economy that is measured in dollars and cents by the reduction in factory costs.

Ingersoll Machine Co., Limited
Ingersoll, Ontario

The Quality Standard That Produces "Plus Service" Belting

The only sure way to get satisfactory service is to buy products of known worth.

In Dominion Rubber System Belting, the worth is known because every ounce of material—each individual operation and each finished belt must test up to the highest quality standard ever made for belting.

From the time the materials come into our factory until the belt is running on your pulleys, there is no chance of your getting anything but "plus service" belting.

This is the result of over fifty years of belt making experience and research by the oldest, largest and most completely equipped rubber organization in Canada.

The rubber that goes into Dominion Friction Surfacing Belting is not a mere waterproofing substance—our chemists have given it a far greater value by making it into a friction compound that prevents practically all power wastage on the pulleys.

"Plus service" includes the free technical advice of our belting engineers who are ready to help you with your transmission and conveying problems without placing you under obligation to us.

A phone call, wire or letter to our nearest branch places all of our facilities at your disposal.

Grinding One of the Miracles of Metallurgy—TISCO MANGANESE STEEL—

IT can't be commercially drilled, filed, chipped or machined—this remarkable Tisco Manganese Steel made by the Taylor-Wharton Iron & Steel Company at High Bridge, N.J. The only practical way to finish a Tisco part or casting is by grinding.

Aloxite Grinding Wheels Meet the Gruelling Conditions

The men on the swing frame grinders say that the Aloxite wheels "hang" to the work, cutting clean and deep—not riding over it. They say that Aloxite wheels are easier to handle, require less pressure, less effort; yet they keep up production records.

They generally use wheels 20 x 3½ x 2 inch 16 grit, I plus grade.

After from forty to fifty hours of abusive, punishing work the wheels have usually lost but three inches. They are then put on stand grinders till used up.

The working conditions, because of the remarkable toughness of Tisco steel and the sharp, jagged, irregular surfaces to be ground, are, perhaps, the most difficult in all grinding.

Yet we have given the Tisco people just the right wheel in the right place—just as we can give you.

Carborundum Products are: Carborundum and Aloxite Grains and Powders, Grinding Wheels, Sharpening Stones, Paper and Cloth, Garnet Paper and Cloth and Carborundum Refractories

Tranco Trucks

The Universal Elevating Truck

MADE-IN-CANADA

Make a Substantial Cut in the Cost of Handling Material

When you adopt the TRANCO method you have something different from the ordinary methods of trucking. You have a simpler method—a method that is more efficient—and one that means a big cut in the cost of handling material.

With TRANCO trucks in operation you pile the material on standardized, movable platforms instead of on the floors, or fixed platforms. Then you convey the loaded platforms by means of the TRANCO truck to its destination, where they remain until the material is disposed of. Time spent in handling is thus reduced to a minimum and much expensive labor is saved. In checking up results it has been found that in many cases one man with a TRANCO truck can do the same amount of work that formerly required five men under the old system of trucking. A big factor this in view of the high cost of labor to-day.

There are three outstanding features of TRANCO Trucks—

1. **Ease of locomotion and operation, acquired by the use of Chapman Double Ball Bearings.**
2. **Operation with steering head and handle at any angle.**
3. **Safety to operator and material.**

Breakage, soilage, scratching or other injury to material is greatly reduced.

The movable platforms are compact, easily stored, and inexpensive.

In their design and construction TRANCO Trucks are all that could be desired. They are built to endure rough usage as well as steer and roll with extreme ease.

You should learn more about them. Write now for full description.

American Punch & Shear Works
HAMILTON, OHIO, U.S.A.

Established 1856 Incorporated 1878

There is Where you will find the
STRENGTH and POWER

CISCO PLAIN MOTOR DRIVE LATHE

Really a geared motor head drive, giving either five or ten speeds. Simple in operation, fool-proof and effective. No overhang, and with the apron control, it almost talks.

The Lathe with the Pull *The Lathe of Simplified Accuracy*

BUILT IN SIZES

14 in., 16 in , 18 in , 20 in , 24 in., 26 in. engine or tool room. Cone off motor driven. Also geared head, plain or motor drive.

BY

THE CISCO MACHINE TOOL COMPANY

ALL STEEL
TRANSVEYOR

THE TRANSVEYOR System has solved the most complicated storage and trucking problems.

You may be familiar with the "idea," but only the TRANSVEYOR on your floor can demonstrate its wonderful labor-saving possibilities.

For ease of operation, long and satisfactory service, elimination of repairs, and the satisfaction of being the leader in its class, buy a TRANSVEYOR. 15,000 "satisfied" users tell the worth of the TRANSVEYOR. Consult our Engineers and get their unbiased opinion on your trucking problems. Write to TRUCK HEADQUARTERS for latest Bulletin.

COWAN TRUCK COMPANY
120 Glenholme Avenue -- TORONTO, ONTARIO

STEEL TUBING

FOR Agricultural Implements, Trolley Arms, Fence Posts, Bedsteads—and all kinds of manufacturing purposes. Reliable quality, uniform in size, 14 to 20 gauge, size ⅜" to 2" outside diameter.

STANDARD TUBE & FENCE COMPANY, LTD.
WOODSTOCK, ONT.

HENDEY At the National Cash Register

Battery of 78 Hendey Lathes in Action

Boring Azimuth Adjusting Cases

Whenever the name "National Cash Register" is mentioned one thinks of efficiency. Here is a firm that has built up an immense business by adhering to this principle. So it was natural that HENDEY Lathes were selected for boring Azimuth Adjusting Cases only after the severest tests. Illustration shows 78 Hendey Lathes in one department and the foreman says they are required to do "boring operations of the most accurate kind." Each lathe turns out 120 pieces per day. Here is proof of Hendey efficiency. Remember this in ordering your next lathe.

There's a HENDEY for every purpose.

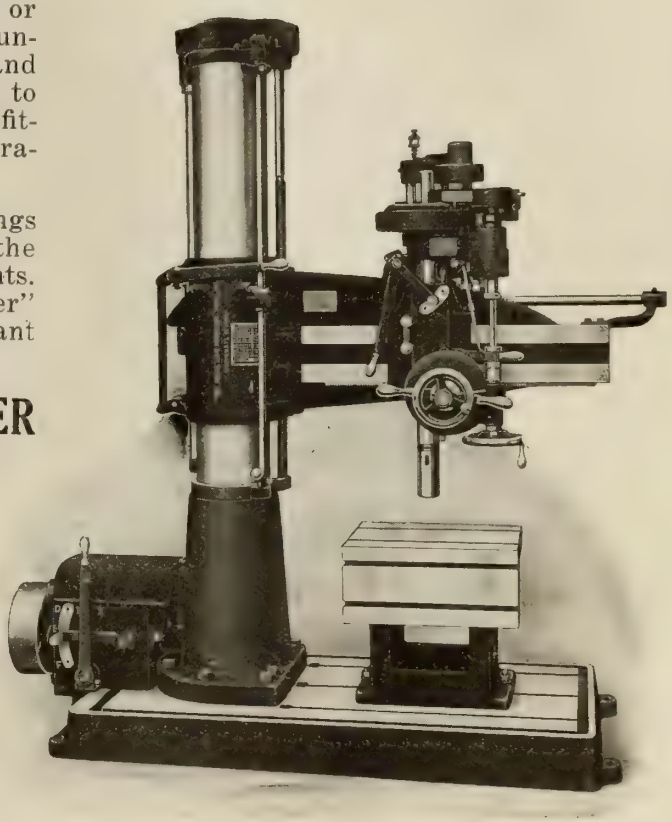
Foss

The Distinctive Rigidity

of the "Mueller" Radials, one-piece, patented column, reinforced with four internal webs; and the long bearing of the arm of this column assures accuracy at the extreme traverse of the spindle even when the arm is at the top of the column. Combination positive, and friction feed, low or high speed friction reverse, unusual operating convenience and other advantages, combine to make it both popular and profitable on a wide range of operations.



One "Mueller" in a plant brings us repeat orders as fast as the expansion of business warrants. The record of each "Mueller" ordered makes the user want more.

Order your MUELLER from *Foss*

You'll get a remarkable combination of quality and service and our own guarantee of absolute satisfaction or money refunded.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper covering is a practical manner the mechanical power, foundry and allied fields.
Published by the MacLean Publishing Company, Limited, Toronto, Canada

Vol. XXIII., No. 7 Publication Office: Toronto, February 12, 1920 $3.00 per year. Subscription Price

"Here's the Time Recorder that earned our dividends for us, Gentlemen!"

"This is how it happened. Last year we put in expensive modern high-speed machines—but we also had an old-fashioned time and cost recording system. Result—our production was disappointing.

"This year my first move was to call in experts from the International Business Machines Company who investigated and showed a convincing report. In each department we now have an International Job Recorder. Each workman prints the exact starting and stopping time on every job.

"It didn't take long to pick out the producers. We've replaced the 'non-producers,' those who didn't measure up, and have brought in new blood.

"Every man in the shop is a paying investment. Some are better than others. We picked 'Job Bosses' and set them on the different operations and after thorough and scientific tests we set a standard output for each machine. Now we are getting it and more because there's a right spirit among the men.

"We've cut out the maddening programme of errors and disputes.

"Briefly, that is the reason why we have earned our dividends this year."

A Rigid Vertical Milling Machine

A vertical milling machine is the ideal type for face-milling, spotting off bosses, milling out recesses and T slots, finishing circular slots and edges and die sinking—but only if the machine is absolutely rigid.

The Garvin machine shown here can be run at high speeds without vibration. Its design combines the convenience of the vertical machine with the solidity of the horizontal types. You can speed production by the use of Garvin Vertical Milling Machines.

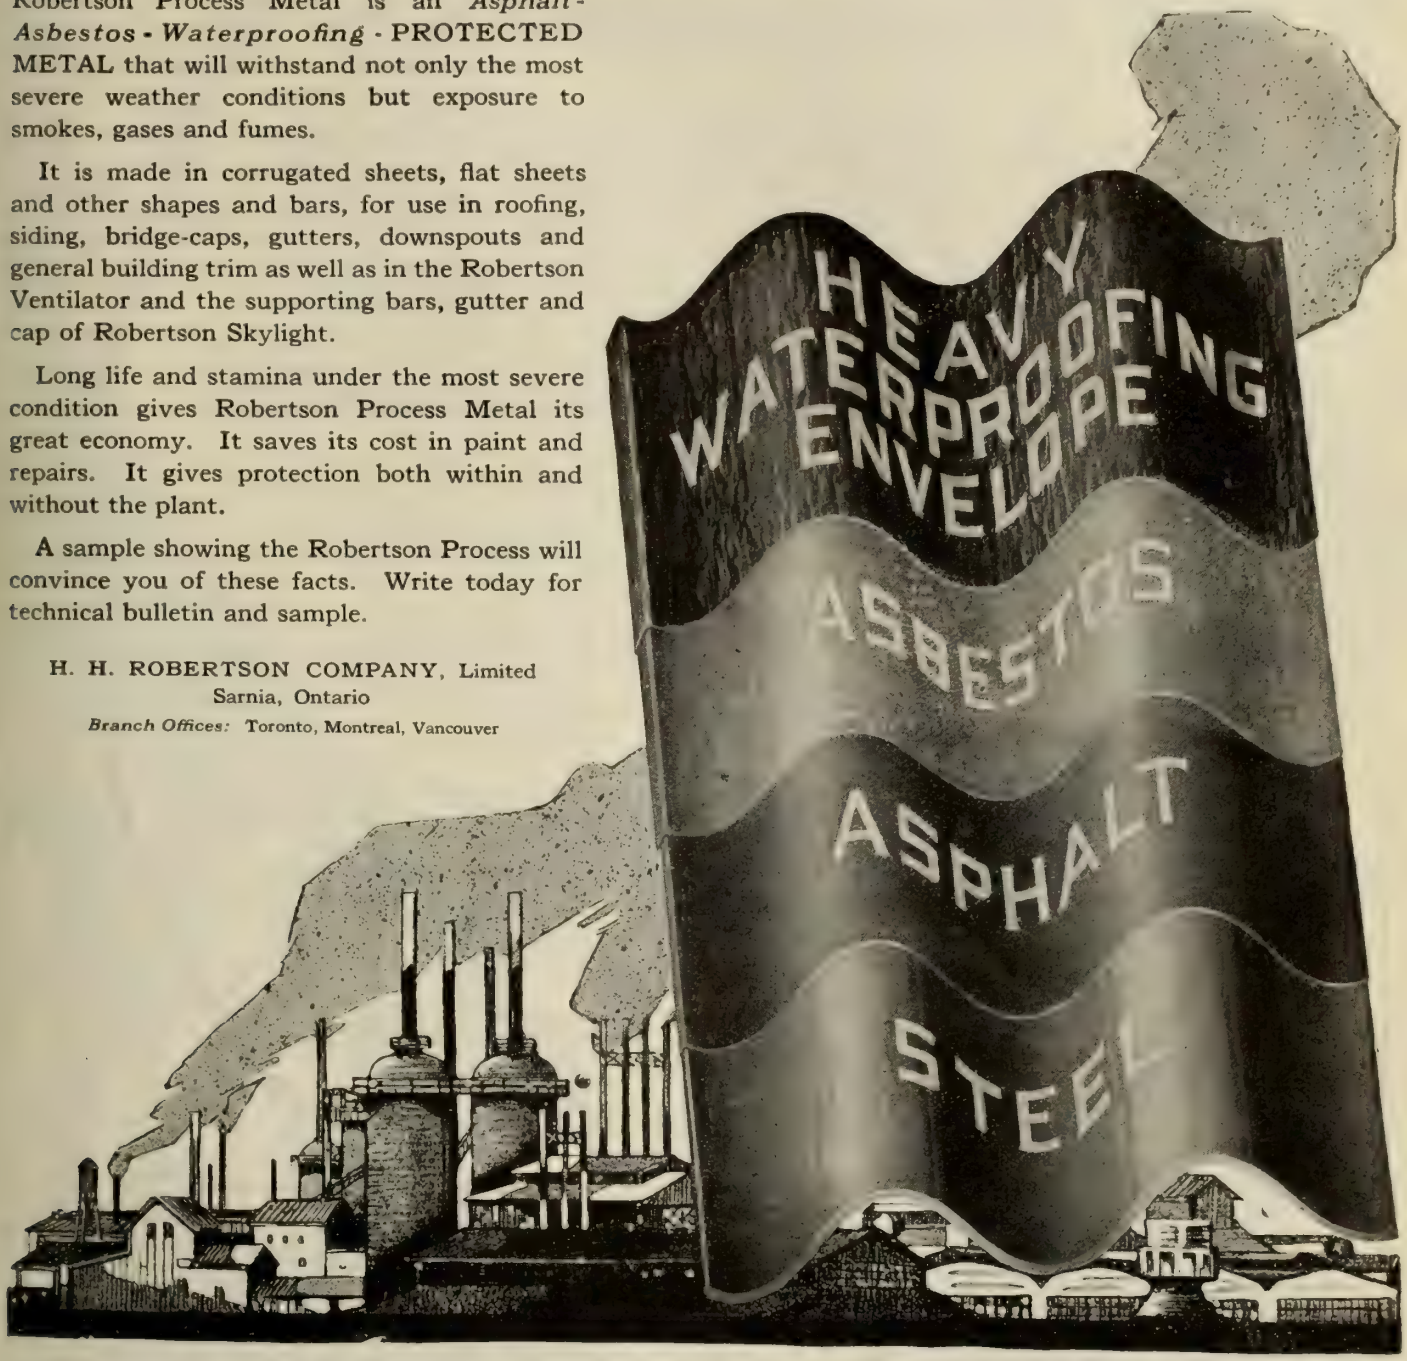
BUILDER OF BETTER MACHINE TOOLS

Robertson Process Metal

What It Is and How It Has Served Industry



Robertson Process Metal is an *Asphalt-Asbestos-Waterproofing* - PROTECTED METAL that will withstand not only the most severe weather conditions but exposure to smokes, gases and fumes.

It is made in corrugated sheets, flat sheets and other shapes and bars, for use in roofing, siding, bridge-caps, gutters, downspouts and general building trim as well as in the Robertson Ventilator and the supporting bars, gutter and cap of Robertson Skylight.

Long life and stamina under the most severe condition gives Robertson Process Metal its great economy. It saves its cost in paint and repairs. It gives protection both within and without the plant.

A sample showing the Robertson Process will convince you of these facts. Write today for technical bulletin and sample.

BUILDING PRODUCTS & HIGHWAY MATERIALS

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the wide-spread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and will soon be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:

ANGLES - Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3".
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2".

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3"

ZEES—
3¼ x 5 x 3¼ x 5/16"
3 5/16 x 5 1/16 x 3 5/16 x ⅜".
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛" x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜".
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 to ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.

NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.

Your enquiries and business will be appreciated

C-I-R-C-O compressors

At the present time compressed air is used in almost every art known to man, and as its use is dependent so much on its economical production the selection of efficient and reliable compressor equipment is of primary importance.

Our line of compressors is the largest, most complete and diversified on the market, comprising machines for steam, belt, electric or gasoline engine drive, in a wide range of sizes and types.

From the tiny "Imperial" Fourteen to the giant PRE, Ingersoll-Rand Compressors embody every feature that will contribute in any way toward producing air at low cost. Service to users is assured by a world-wide organization and mechanical excellence by the experience, reputation and permanence of the builders.

A postal card to our nearest branch will bring you a set of our compressor bulletins.

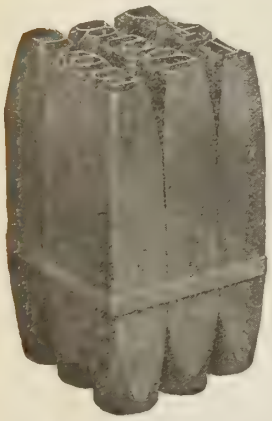
Chucks that have won their place



Jacobs Chucks have come to be as much of a necessity in modern industry as the drills they hold so firmly.

They have won their place by their durability, their firm grip, their freedom from drill breakage, and the ease with which they permit the changing of drills.

If you would know the value of Jacobs Chucks, ask any mechanic who has used them.

BABBITTS—

Lower your Babbitt Metal costs per year!

Lion-royal—the babbitt for general use.

Sterling — a high-grade medium cost Babbitt for important bearings.

Sovereign Genuine—the highest grade of Babbitt made. Costs more—lasts longer—worth more.

The expense of babbitting your bearings—labor cost—non-production cost while the machinery is idle—far outweighs the consideration of cost per pound.

Make your bearings run longer without rebabbitting. You can do it by lining them with Babbitts made from

WILLIAMS' SUPERIOR DROP-FORGED CLAMPS

THERE'S a Williams' Clamp for every purpose.
If it's extreme strength and heavy service — Williams' "Vulcan" line provides both.
11 sizes, ¾ to 12½ inches capacities.
If it's general utility—without need for maximum strength — Williams' "Light Service" line will fit the case, 8 sizes, 2 to 12 inches capacities.
If it's stability and utility—medium service—Williams' "Agrippa" line offers the solution. 7 sizes, 4 to 18 inches capacities.
If it's tool room work requiring comparatively small openings of jaws—Williams' "Vulcan" Tool Makers' line should be chosen. 4 sizes, 1 to 4 inches capacities.

All are made of a special, high-grade steel. After forging they are submitted to a refining process, or "heat treatment," which increases their stiffness and strength and reduces the liability of springing.

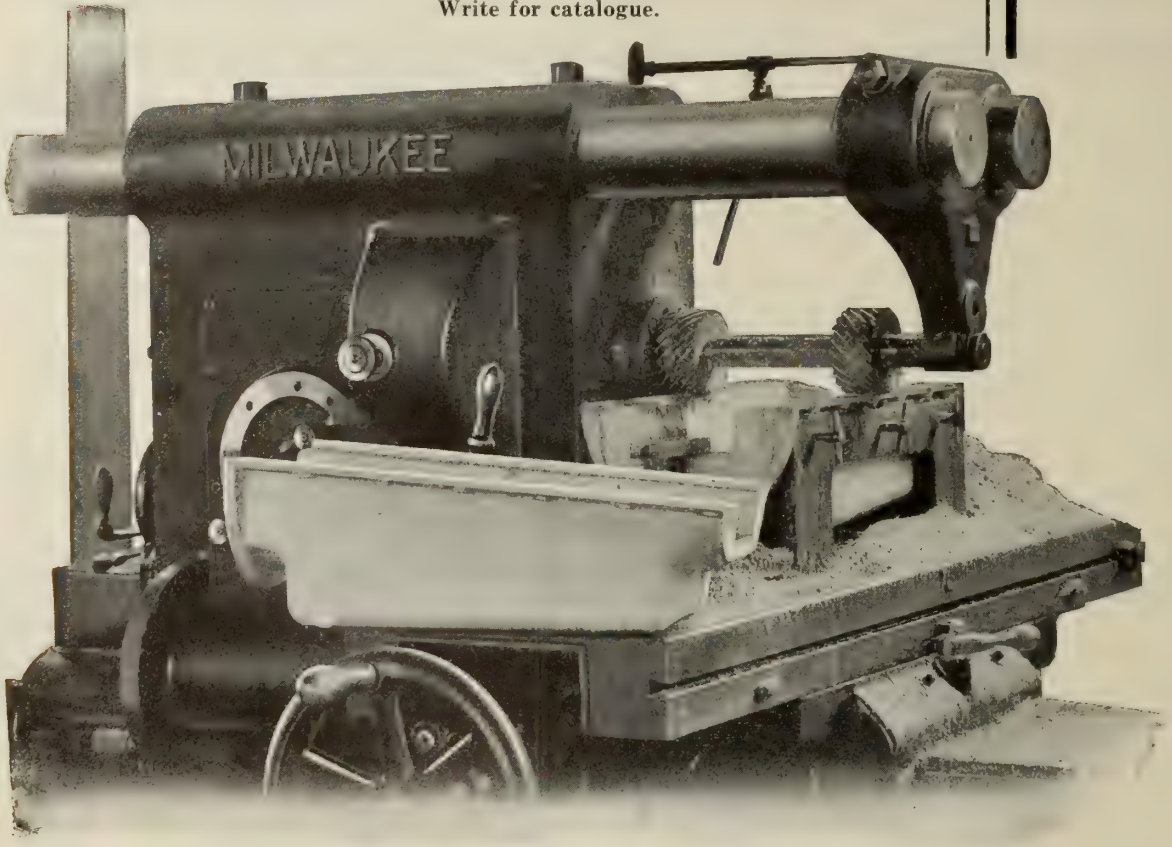
MILWAUKEE MILLING MACHINES

High Speed Milling on Aluminum Oil Pans



The milling of aluminum oil pans, as illustrated, is being done on a No. 3B Plain Milwaukee Milling Machine. The cutters, 4 in. dia., 2 in. face, running 320 R.P.M., remove 3/16 in. stock, the table feeding 16 in. per minute.

When one pan is finished, another is clamped in its place and the feed is reversed. A smooth surface is produced with one pass of the cutters in either direction.

On account of the rigid double overarm construction, arm braces are not necessary, thus facilitating for the rapid loading and unloading of the work. Note that one cutter is held far from the face of the spindle.

Milwaukee Milling Machines possess many features of merit, some of which are—One-piece box section column, reinforced with heavy vertical and horizontal internal walls; solid top, box section knee with extended slide; table, large and convenient; double overarm, exceptionally rigid; flanged spindle, highly efficient; automatic flooded lubrication system, thoroughly lubricates all bearings and gears in the column, feed box and pulley bracket; cutter lubricating system, operates only when spindle revolves; constant speed drive.

Write for catalogue.

9 in. x 4 ft. Style "K" "STAR" Screw Cutting Bench Lathe

THIS LATHE IS A THOROUGHLY PRACTICAL MACHINE FOR SMALL WORK IN THE TOOL ROOM AND PRODUCTION WORK IN THE SHOP. Equipped with one or more of the many attachments, it handles a variety of operations and is a very fine lathe for the model maker and for experimental and scientific work.

It embodies all the most approved features of up-to-date lathe design and is made with the finest workmanship from the best materials obtainable.

Compound rest, spindle bored for draw-in-chuck, right and left standard threads 3 to 72 per inch, micrometer dials, change gears and full tool equipment, countershaft, etc. Bench type or with legs. Foot power if desired.

A lot of your smaller work can be handled by a 9 in. Star, releasing the inconvenient and expensive heavier machines for larger work.

The Star is the national way. It means a big economy in time, overhead and power.

Oxy-Acetylene Welding and Cutting

Cutting ¾-inch Sheet Steel Piling (including lock joints 2¼ inches thick) by the Prest-O-Lite Process.

One Man Does the Work of Two In Less Time, at Less Cost

This illustration shows one man, with a Prest-O-Lite blow-pipe, cutting ⅜-inch sheet steel piling, used in the construction of the protection piers of a large drawbridge. This one man handled the entire job, cutting an average of seven feet of piling per hour—an enormous saving over the old slow and costly method of sawing, which required the services of two men.

Prest-O-Lite PROCESS

offers splendid opportunities for substantial savings in manufacturing construction and repair work.

Prest-O-Lite Oxy-Acetylene welding and cutting is opening the way to construction and repair operations which cannot be performed by any other process.

Employs both gases (acetylene and oxygen) in portable cylinders, Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders, for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the process quickly and easily. There is practically no line of metal manufacturing or repairing in which oxy-acetylene welding has not already established itself firmly as standard routine method.

Write for valuable illustrated literature and data on work others are doing by Pres welding process. It point out ways to solve your problems.

CLEVELAND HOSE SPECIALTIES

Bowes Automatic Air Hose Couplings
Standard Equipment Everywhere

The Cleco Never Slip Hose Clamp
Made in same sizes as Bowes Couplings

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.
STYLE I.F. is an inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.
STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE O.M. is an Inside Thread Male Pipe End Made in sizes ¼-in. to 1½-in.
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.
The Male and Female Ends of Bowes Couplings interchange in sizes ¼-in. to ⅜-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ⅜-in.

The adjoining cut of Cleco Never Slip Hose Clamp shows the "Flanges" which engage the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings and valve to use and proper way to attach the clamps.

CLECO GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently.

WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, etc.

Use Annealed Wire No. 14

Write for Bulletin 38 illustrating Cleco Hose Fittings, Couplings, Valves, etc.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Bulletin 34A, 41 and 43.

Enduring Service, Landis Service, Satisfaction

The rapid and efficient tool wins a quick place for itself, but unless it survives hard service, it will never retain it. How Landis tools are built for long service is a long story, but here are some facts that are bound to impress:

LANDIS

All the main details are of unusually heavy construction.
The columns are side-braced in two directions.
The floor plate and runways are massive and very stiffly ribbed.
All bearings are of high grade bronze.
Gears and shafts are of specially heat-treated chrome nickel steel.

The whole story is in our catalog. You should read it.

CLINTON CEMENT

—makes furnace linings last longer

The linings of these brass furnaces don't last long when they are cemented with fireclay. Under high temperature the fireclay dries and then burns out, leaving open joints in the brick lining.

Clinton Cement prevents this disintegration because it sets to a flexible glass hard surface that allows for expansion and contraction and stands temperatures up to 3000° Fahrenheit.

Try it on your furnace linings—on any fire brick that gives trouble. We will send you for trial a five-pound tin of Clinton Super-Heat Cement, free and all charges prepaid.

Sometimes a Smalley-General Thread Miller is more profitable on small work than a screw machine

Here's an Example:

Studs like this are common enough. You've probably got half a dozen of them in the machine you're manufacturing.

Possibly you've tried to save money by turning them out in a screw machine and then gone back to the old reliable lathe because the screw machine wasn't accurate enough and didn't give a good finish.

If you've had this experience you'll be interested to know that ordinary intelligent labor on the **Smalley-General Thread Miller** will turn out threaded parts with more accurate diameters, better finish and greatly less time than the skilled mechanic on the engine lathe. We're publishing the time study here for comparison. Don't you think it worth while to let us study your blueprints and give you guaranteed production estimates on your threaded work?

MATERIAL—.30 Carbon Steel.

SCREW MACHINE TIME—30 seconds, approx., not including chucking.

LATHE TIME—14 minutes, approx.

THREAD MILLER TIME—1½ minutes, floor to floor.

This particular job required accuracy, finish and parallel thread and hence was done on a thread miller in preference to screw machine.

Smalley-General Co., Inc.

Bay City, Mich.

Canadian Agents: Rupel-Belnap Co., Montreal and Toronto

Goodyear Builds Better Hose

There was a time when men thought that rubber tires had reached their limit of quality. Then Goodyear entered the field, and, by leaving the beaten path, built the largest tire business in the world.

When Goodyear scientists and engineers turned their attention to Industrial Hose they were not satisfi d with many of the existing standards. They started from the ground up. They built for Industry's needs. Was the rubber lining unsatisfactory—Goodyear men worked till they had discovered a better one. Did a cover wear out too quickly in hard service—the knowledge gained in building automobile treads was applied to hose covers. New specifications were worked out. New formulae were developed.

The Goodyear Industrial Hose offered you today is the result of a definite policy. It is the *solution* to your hose problems—not a makeshift.

In mines, mills, foundries, shipyards, railways, and a hundred other industries, all over Canada, it is setting new standards.

There is a Goodyear Industrial Hose for every particular use—yours among them. Let a man, trained by Goodyear in hose problems, call and explain them to you. No obligation. Phone, wire or write the nearest branch.

ALUNDUM WHEELS IN THE FOUNDRY

A 20 x 3½ x 2 inch, 6616 grade Q Alundum wheel was used for this difficult snagging operation.

To remove the heavy fins and burrs from the rough and jagged castings when they come to the cleaning room the grinding wheel must be free cutting and cool cutting.

The important facts to remember are:

1. The grinding wheel should be of ALUNDUM abrasive.

2. The grain and grade depend upon such conditions as ***operating speed, contact of work with wheel, rigidity of machine*** and perhaps others.

Start with "Alundum" and make use of Norton engineering service to fix the other conditions and you will get production at low cost, which is what you are striving for.

THE R. McDOUGALL COMPANY, LIMITED, GALT, ONTARIO

The Canadian Fairbanks-Morse Co., Limited, Sales Agents

2 Minutes or 20?

This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

Details of the C.P.R. Mikado Type Locomotive

By J. H. RODGERS

PROGRESS is a force no man can stay. Richard Trevithick, the first engineer to make practical use of steam as a power for locomotion, may have visualized in his mind's eye the future development of the steam locomotive, but the achievements of present-day engineering in this direction are doubtless far beyond the fondest dreams of the pioneers in this branch of science.

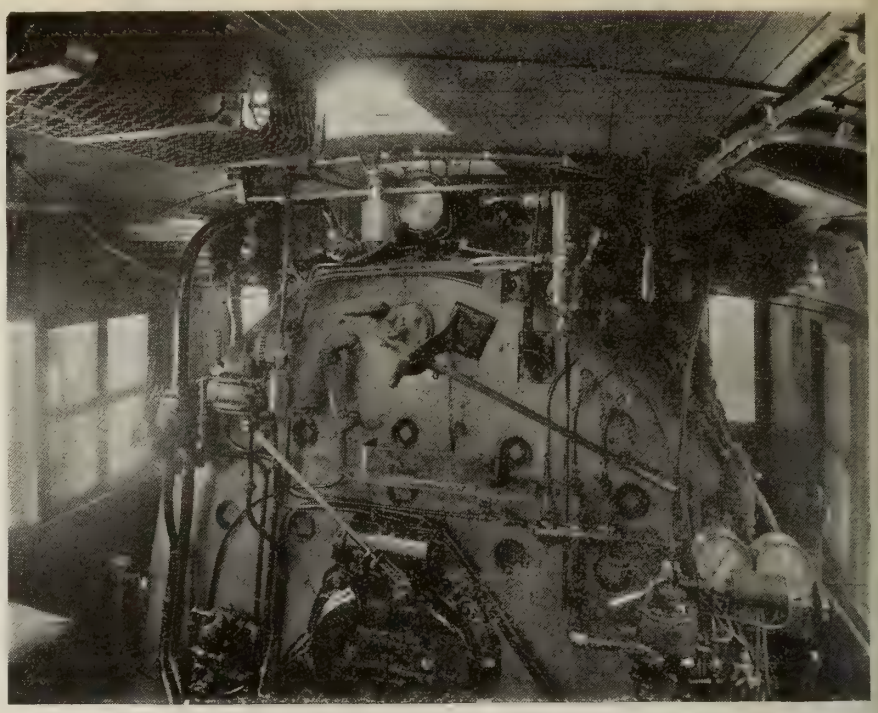
The Mikado type locomotives recently completed at the Angus shops of the Canadian Pacific Railway registers another mile post in the progress this company has taken in keeping Canada in the forefront of mechanical evolution. The final delivery of the initial order of 10 of these locomotives has just been made and the present program calls for the construction of four new types: a Mikado type locomotive, having a tractive effort of 56,000 lbs., two classes of Pacific type locomotives with 43,700 lbs. and 42,600 lbs. tractive effort respectively, and one of the Sante Fe type with a tractive effort of 66,000 lbs.

The design of these locomotives has been carried out by the mechanical engineering staff of the C.P.R., the construction taking place at the Angus shops, under the direct supervision of W. H. Winterrowd, chief mechanical engineer, and W. A. Newman, engineer of locomotive construction, to whom we are indebted for the data and photos accompanying this description.

While there has been no radical change in the general design of these locomotives, they being quite similar to those constructed by the C.P.R. in 1912, special attention has been given to detail design, and every effort has been made to produce a common-sense locomotive, which will give reliable and efficient service and economical in operation.

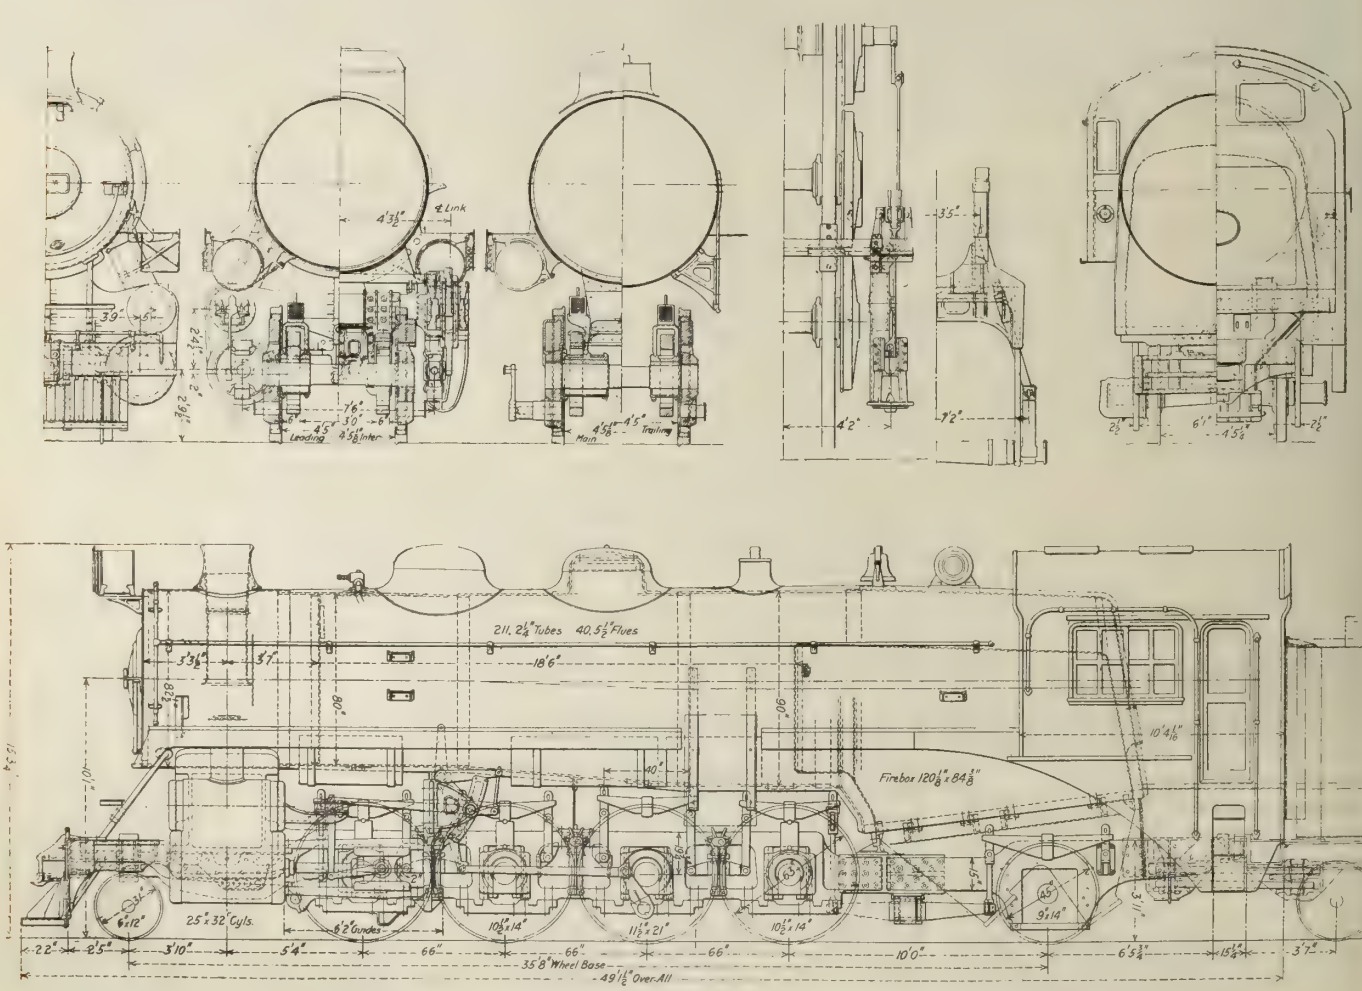
Boiler Construction

A departure has been made in the design of the boiler, which is built on the extension wagon-bottom type, a feature that gives a more pleasing appearance in the upper lines of the engine. This class of boiler, while not actually an experiment, is the first of its kind to be adopted on the Canadian Pacific locomotives. The decision to try out this type of boiler was the result of considerable investigation and careful study, on the part of the designing engineers of the company, regarding boiler proportions and constructions, every care being taken to insure ample steam generating capacity, combined with easy steaming qualities. Some of the reasons for the adoption of this particular type of boiler may be briefly stated as follows: By locating the steam dome further forward, or on the second course, the seam construction on the course adjoining the fire-box has been much simplified; the standpipe is separated from the crown sheet by a greater distance, and, therefore, is further removed from the extreme ebullitions that occur close to the fire-box section; the dry-pipe is much shorter, so that the length of the steam passage, from the throttle valve to the cylinders, is correspondingly reduced. Still another advantageous feature is the increased steam storage space thus provided, which, it is estimated, will add materially to the superheating efficiency.



The boiler has an overall length of 38 feet 10 inches, with a diameter of 80 inches at the forward end, and 90 inches on the course adjacent to the fire-box. The capacity is based on Cole's ratio and is approximately 102.5 per cent. of cylinder requirements. The 2¼-inch tubes, of which there are 211, have a length of 18 feet 6 inches, a ratio length to diameter considered as most efficient. Another pioneer construction feature of the boiler is the use of a 28-inch barrel combustion chamber, the first of this type installed on C.P.R. engines. The mudring is of special interest, inasmuch as the cast steel ends are welded to wrought iron sides, the end portions of the steel sections being provided with drop corners to permit of through rivet-

ing for the corner fastenings of the inside fire-box sheets.



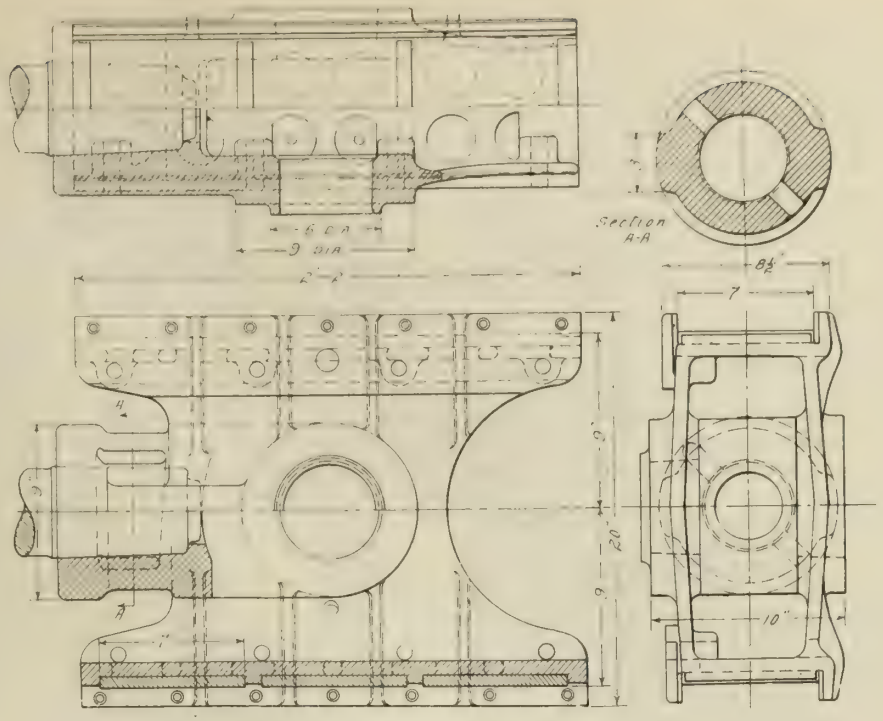
Main Frames

Experience has shown that no small amount of locomotive trouble has developed through frame breakage, and records indicate that the majority of such breakages take place immediately behind the cylinders. In an effort to eliminate, or at least minimize, this evident source of trouble, the designing engineers have provided adequate means to reduce the twisting strains apparently resulting from insufficient fastening at this point of the frame. The extension gives an additional depth of 15 inches directly back of the cylinders, and this portion of the main frame is firmly bolted to a corresponding lug on the back end of the cylinder casting, giving a total vertical bolting surface of 20½ inches.

The frames are of the single front rail type, with a uniform thickness of 6 inches, which is a little heavier than is usually found in general locomotive practice. Additional rigidity is further provided by a special wedge casting located beneath the saddle portion of the cylinder castings and between the main frame connections. The lugs of the castings are tapered, so that a firm wedge joint is secured by driving the lower casting into position and then bolting together with the vertical bolts to the saddle, and the side or horizontal bolts to the frame and cylinders. These alterations in design were deemed essential, in view of the fact that the engines will be used in sections of Canada where extremely low temperatures are frequent occurrence. The portion of the frame that carries the trailing truck is

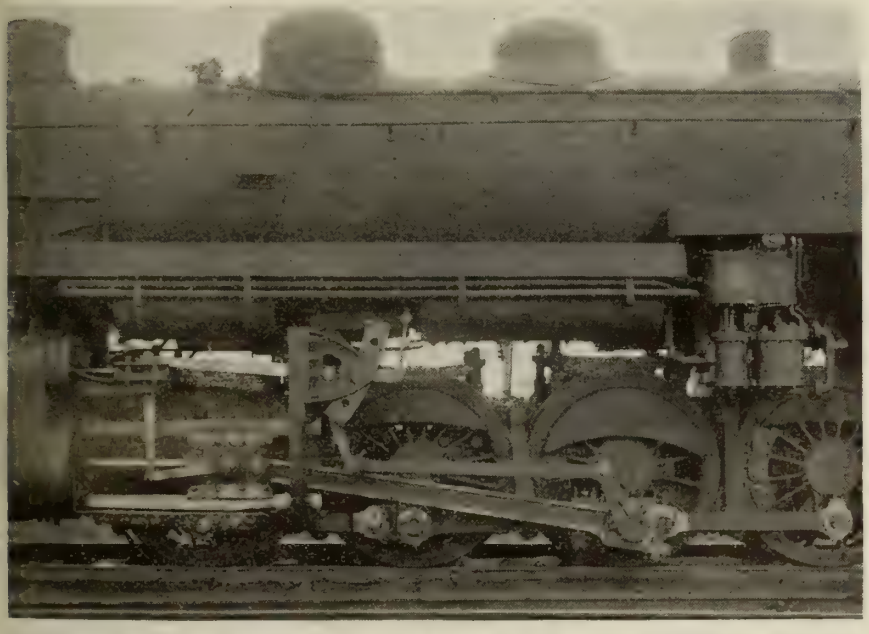
BACK HEAD OF BOILER SHOWING CONVENIENCE OF ENGINE CONTROL — C. P. R. MIKADO LOCOMOTIVE.

Elevation and Cross Sections of Mikado 2-8-2 Locomotive and Arrangement of Ragonnet Reverse Gear



2½ inches thick, and joined to the main frame by a special offset connection.

Vaughan Trailing Truck

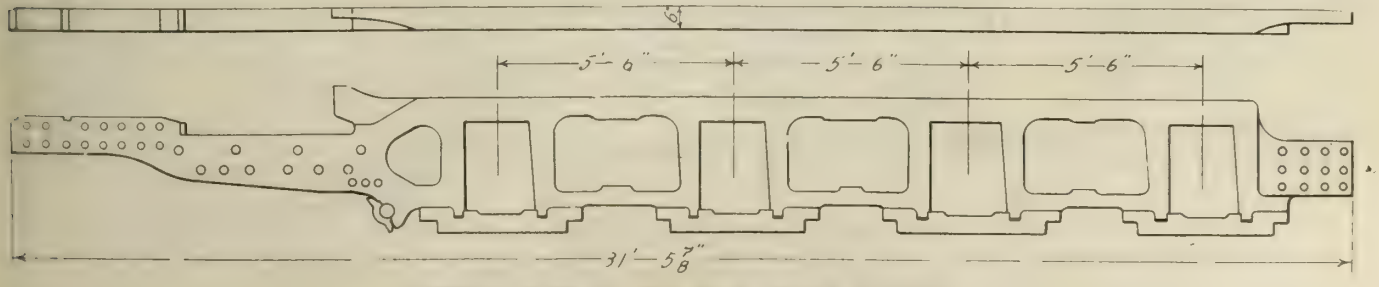


These Mikado locomotives are equipped with the Vaughan trailing truck, a type that has given entire satisfaction on C.P.R. engines for the 13 years they have been in continuous service. The frames for the trailing truck are located outside of the trailing wheels and are spaced 6 feet 3½ inches between centres. No radius bar is used with these trucks, the guiding motion being controlled from inclined vertical faces on the journal boxes, which bear on corresponding inclined faces on the pedestals attached to the extension frames.

Ash Pan Construction

One of the details of construction that has been given more than ordinary attention is the design of the ash pan. It is generally recognized by railroad engineers that the ultimate efficiency of an engine on the road is dependent, very largely, on this apparently minor portion of a locomotive makeup. This is particularly true in respect to those engines that may be called upon to operate in cold climates, under which conditions it is imperative to provide ample capacity and effective facilities for the discharge of the contents. The construction of the Vaughan truck, with its wide frame, allows of pan construction relatively free from flat horizontal surfaces, and with quick slopes at either side of the trailer axle for clearing purposes. In fabricating the pan the joints are made with sheet asbestos, and, wherever possible, the corner angles are placed on the exterior, so as to obtain an unobstructed surface on the inside. The safety factor has been intentionally incorporated in the construction of the pan, so that accidental dropping of hot ash or clinker is prevented by the automatic closing of the ash pan doors, the pivot supports of the doors being located back of the door centre of gravity, so that the doors are self-closing immediately the operating lever is removed.

DETAILS OF CROSSHEAD.



GENERAL VIEW OF THE ROD AND VALVE MOTION — MIKADO FREIGHT LOCOMOTIVE.

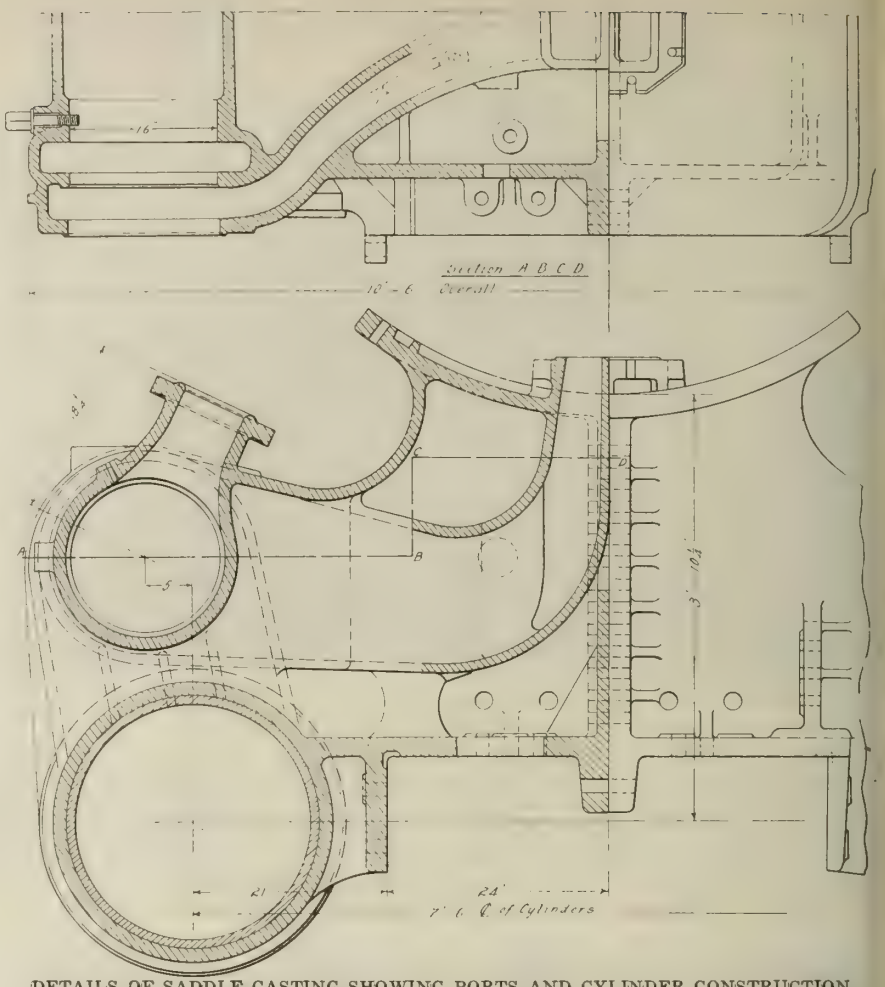
Moving Grates

In the past it has been found that the use of dead grates has given rise to much trouble in operation, so that this type of grate has been entirely replaced by the movable type, and the design finally adopted in these engines is of the butt finger type, 10 inches wide, and made in four sections. The centre carrier is of very light cast steel construction, and is reinforced along the lower or tension member by a structural tee iron. Every consideration has been given to design of side carriers to avoid excessive warping. These carriers are in two sections, which facilitate repairs to fire-box corners, as only one section of the grates need be removed.

Rods and Link Motion

The construction of the piston heads

GENERAL VIEW OF THE MAIN FRAME FORGING.



differs somewhat from previous practice, as exhaustive analysis, both mathematical and by actual tests, have been made at the Angus shops to determine the specific stresses to which piston heads are subjected. The result has been a great saving in weight, as the pistons in these engines are considerably lighter than those two inches smaller in diameter, which have, until now, been accepted as standard on other C.P.R. locomotives. The cast iron crosshead, which is made in one piece, is a modification of previous standard patterns. The design provides for six removable cast iron wearing pads—three top and bottom—each of which is 7 inches long by 6¾ inches wide. These sections are kept in position by side plates bolted to the crosshead body.

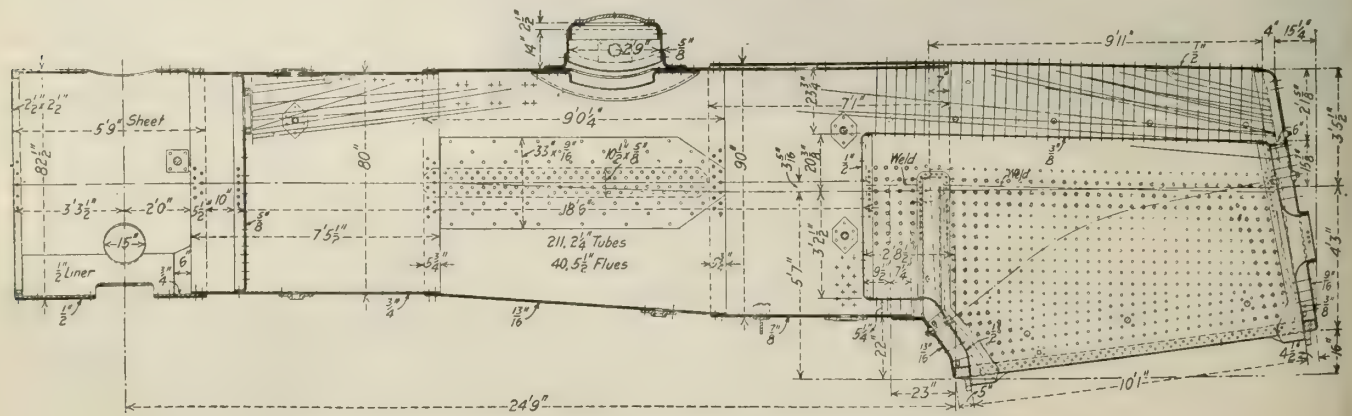
An interesting detail in connection with the valve operating link motion is the change effected in linking up with the crosshead. The union link is apparently fitted to the wrist pin, but actually works on a bearing formed by a step on the inside washer, which, in turn, fits on a tapered shoulder of the crosshead body. This has the advantage of relieving the wrist pin of any thrust from the valve mechanism through the union link.

By paying particular attention to every detail of reciprocating motion a remarkable saving has been effected in weight of moving parts. These are all made of carbon steel, but are only 96 lbs. heavier than on those used on lighter Mikado locomotives. The increase in weight of reciprocating parts is approximately 5.87 per cent., while the increased piston load is 31 per cent. —a creditable achievement.

Arrangement of Control

One of the problems of locomotive construction is the arrangement of the control and operating mechanism, 95 per cent. of which is located within easy reach of the engineer or fireman in the cab of the engine. Effort has been made to obtain the most convenient and efficient layout on the back head of the boiler, so that all valves, throttle lever, lubricators, air brake control equipment, etc., would be properly located and at the same time allow both the engineer and firemen to have an unobstructed view of the water glass and the steam gauge.

DETAILS OF SADDLE CASTING SHOWING PORTS AND CYLINDER CONSTRUCTION.



The vestibule cab is of the standard C.P.R. type, but owing to the width of fire-box it prevented the placing of the brakeman's seat in front of the fireman, as is generally the case. The cab is amply provided with wood-lined lockers for the crew's clothes, etc. Signal equipment is carried in a special wire rack located on the ceiling of the cab.

Standard C. P. R. Tender

The tender is of the water-bottom type. The tank, which has a water-carrying capacity of 8,000 Imperial gallons, is supported on a Commonwealth one-piece cast steel underframe. The coal space provides for a capacity of 12 tons, and the 45 degree slope of the back sheet insures a constant feed of coal to the front of the coal space, this feature dispensing with the use of a coal pusher. This is standard practice in C.P.R. tender construction. The swash plate bracing is arranged to minimize rivet strain.

Air Brake and Special Equipment

The air brake is the Westinghouse schedule "ET" with cross-compound

Extension Wagon Bottom Boiler for Canadian Pacific Mikado Type Locomotive

compressors. Ample cooling surface is provided in the air brake piping, 2-inch pipes being used between the compressor and the first reservoir. A parasite reservoir is also part of the air system, and the pressure is controlled by a Westinghouse parasite governor.

The locomotives have a total weight of 320,500 lbs., with 235,000 lbs. on the driving wheels, which gives a factor of adhesion of 4.18. The cylinders are 25 in. by 32 in.; driving wheels 63 inches in diameter, which, with a normal boiler pressure of 200 lbs. per sq. in., gives a maximum calculated tractive effort of 56,000 lbs.

The locomotives are hand-fired and have proved exceptionally good steamers, and quite live up to the expectations of economy in coal and water.

The Art of Properly Splicing Wire Rope

The art of properly splicing wire rope is something that is not understood by very many mechanics in spite of the fact that it should be one of the things about which they should know. The result is that in many cases a faulty splice is made, and an accident of some nature or other at a later date. We received a short time ago, from the Canada Wire and Iron Goods Co. of Hamilton, a very interesting catalogue on their line of wire rope and fittings, and in this book was a short article on the proper splicing of wire ropes, which is well worth reproducing.

Before going into the article proper, however, we might add that to any one interested in wire ropes, their uses and applications, a copy of this price list catalogue for 1919 is well worth a place on the desk.

The subjects of wire rope construction, materials used, the proper method of ordering and other valuable information are all given. Certain tables of useful information are also added at the back portion of this interesting book.

To get on to the subject of the splicing of wire rope, however. Following is the method in which they present this material.

Directions for Splicing Wire Rope

Wire rope is susceptible to the most perfect splice; a smoother and better splice can be put in a wire rope than in any other kind of rope, for the simple reason that it is made with a view to this purpose. It has just the desired number of strands, namely, six, and a hemp core, which provides a place for fastening the ends. It is a plain, simple process and but the work of an hour for any one to learn.

To Get the Length of the Rope to be Spliced Endless

In most cases the ropes can be applied endless, and in such cases the ropes can be forwarded spliced ready to go on. We can furnish ropes ready spliced by giving us the exact distance from centre to centre of shaft, and the exact diameters of the wheels on which the rope is to run. This measure can be got best by stretching a wire from shaft to shaft, marking the distance from centre to centre of shaft and carefully measuring the wire.

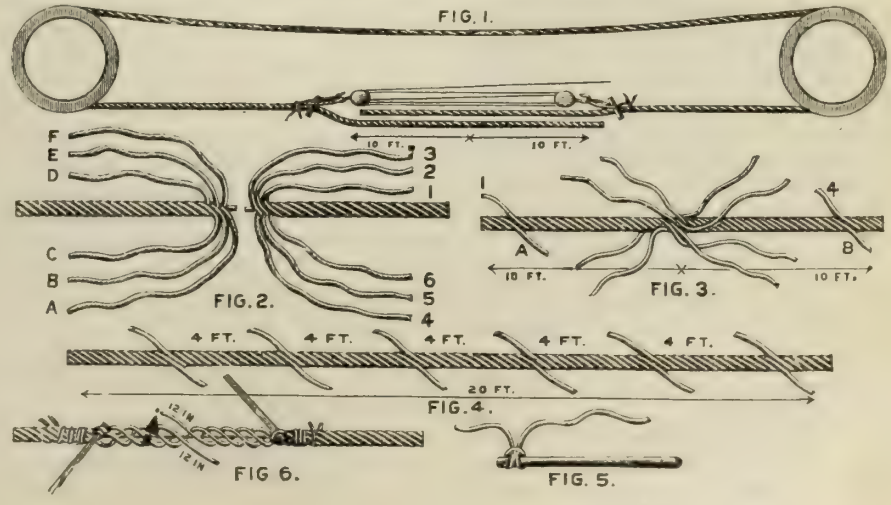
In cases where the endless rope cannot be put on, the rope has to be put around the sheaves, hove taut by pulley blocks, and the splice made on the spot. See Fig. 1 in diagram of splices.

The Necessary Tools

A hammer and sharp cold chisel for cutting of ends off strands; a steel point or marlin spike for opening strands; two slings of tarred rope with sticks (see Fig. 5) for untwisting rope; a pocket knife for cutting the hemp core; a wooden mallet and block.

First.—Put the rope around the sheaves, and heave it tight with block and fall (see Fig. 1). The blocks should be hitched far enough apart so as to give room between to make a 20-foot splice. A small clamp may be used to prevent the lashing from slipping on the rope where the blocks are hitched (see Fig. 1). Next, see that the ropes overlap about 20 feet; about ten feet each way from the centre, as shown by the arrow lines in Fig. 1. Next mark the centre on both ropes with a piece of chalk or by tying on a small string. Now proceed to put in the splice, with the blocks remaining taut when it is necessary, but the better way is to remove the blocks, throw off the rope from the sheaves, let it hang loose on the shafts, and then proceed with the splices on the ground or floor, or scaffold, as the case may be.

Second.—Unlay the strand of both ends of the rope for a distance of 15 feet each, or to the centre strand of both ends of the rope for a distance of 15 feet each, or to the centre mark. Next cut off the hemp cores close up, as shown in Fig. 2, and bring the bunches of strands together so that the opposite strands will interlock regularly with each other (see Fig. 3).



Third.—Unlay any strand A, and follow up with one strand of the other end, laying it tightly in open groove made by unwinding A; make twist of the strand agree exactly with the twist of the open groove. Proceed with this until all but twenty-four inches of one are laid in Next, cut off A, leaving an end about twenty-four inches long.

Fourth.—Unlay strand 4 of the opposite end and follow with strand D, laying it in open groove as before, and treating this precisely as in the first case (see Fig. 2). Next, pursue the same course with B and 2, stopping six feet short of the first set. Next, with 5 and E, stopping as before, then with C and 3; and lastly with 6 and F. The strands are now all laid in with ends six feet apart, as shown in Fig. 4.

Fifth and Last.—The ends must now be secured without enlarging the diameter of the rope. Take two rope clamps (see Fig. 5), and fasten them to the rope, as shown in Fig. 6; twist them in opposite directions, thus opening the lay of rope.

Next, with a knife cut out the hemp core for the necessary distance. Now straighten the ends and drive the marlinspike under the strands (see Fig. 6), and work end into the space previously occupied by the hemp core; then twist the clamps back, closing up the rope. The ends should be laid in, side by side—that is, they should not be crossed over each other. At the point where tuck is made, hammer with copper mallets to fix the strands firmly in place. Next, shift the clamps and repeat the operation at the other five places, and the splice is made.

A portable bath cabinet invented by a North Carolinian includes tub, tank for both hot and cold water, oil heater, medicine chest, towel rack, closet and extension seat.

Interesting Operations in Machining of Elbows

By F. SCRIBER

THE ELBOW, shown in position as held by the various fixtures used in connection with the machining of the finished surfaces, is first sand-blasted and all lumps are ground off, following which the flange is drilled. The large diameter is then turned, the hole is chamfered, the flange is faced on the side next to the turned diameter and as a sequence to this the flange is profile milled to the outline shown so it will conform to the outline of the part it is to be bolted against.

Three fixtures are used to handle this part efficiently and the first operation consists of drilling the six holes in a manner as provided for by the fixture illustrated in Fig. 1.

The interesting feature of this fixture arises from the fact that the base A is merely used as a block to support the elbow, it being of cast iron, finished top and bottom only, while the portion B is in reality a template made of cast iron with six guide bushings C for locating the drilled holes, which is done relative to the boss X by having two pins D straddle loosely any one of the six bosses. Apart from this the plate B is located from the large centre hole of the elbow by means of three pins E that are caused to expand by the screw F, with hand-knob G working on their bevelled ends, these pins being held in position by screws and springs H.

With the template in position on the work the same is slipped over two pins J in the base of the fixture, thereby tying the entire arrangement together for locating in the drilling machine, this operation being performed in the usual manner, care being taken when drilling hole K directly over the curve not to force the work into a tilted position on the fixture, this being easily accomplished by keeping the hand not in use operating levels on the left side of the template.

In turning this elbow Fig. 2 advantage is taken for locating purposes of the holes previously drilled, which locate each elbow centrally under the boring head of the machine and at the same time counteract any tendency to turn under the cut, pins A enter two holes and are used for this purpose. The base B of this fixture contains two slides C which are held in place by plates D. These slides are adjustable by means of screws E and they are used for clamping the work on the periphery in a manner obvious from the illustration, it being also apparent that this fixture is clamped to the table of the machine using tongues F for locating from the slots of the same.

The cutting operations at this time consist of turning the diameter X and facing the flange with box tools, facing the end and chamfering the beveled hole, all of which are performed on a horizontal boring mill by using standard types of tools.

A difficult operation to perform is that of profile milling the outer form around the bosses and periphery, but by setting the elbow up as arranged for in the fixture, Fig. 3, this is well taken care of, and after describing the manner of holding, the operation of profile milling will be described, at which time reference will also be made to the cutter, Fig. 4.

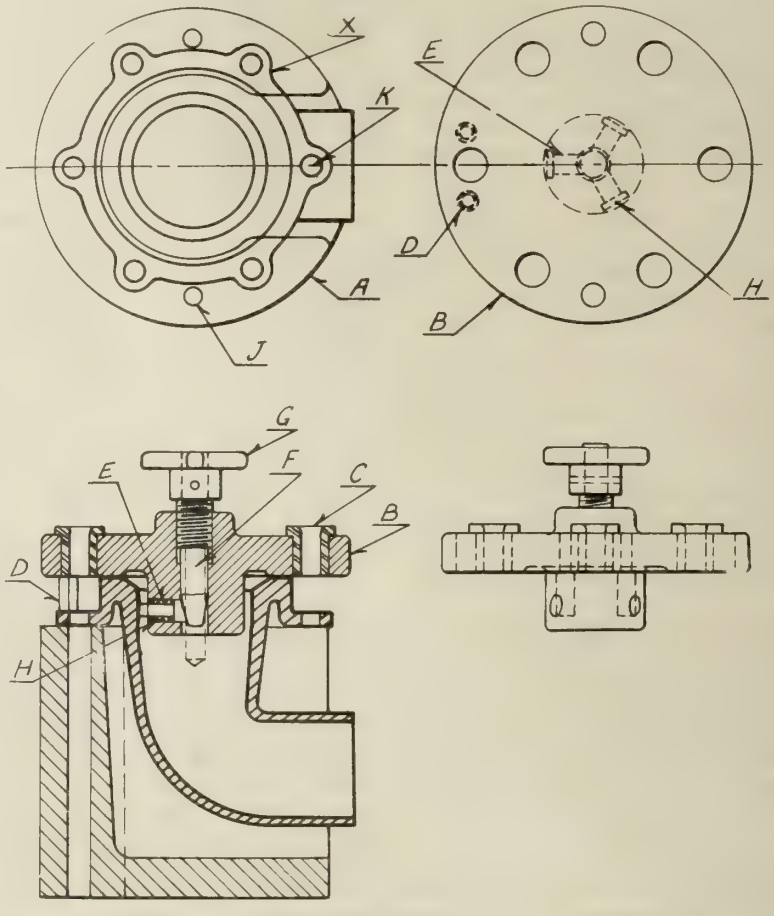


FIG. 1. ILLUSTRATING THE DRILLING FIXTURE.

Referring to Fig. 3, with plate A entirely removed from the fixture, the elbow is placed over the curved post B, and it is allowed to rest on the three spring pins C which have the end turned down at Z to enter three holes in the work, thus locating the same radially upon the base D. Next the formed plate A is slipped over the curved post B, a key E being used to locate the same with reference to the post. The three bolts F are now put in place through the plate and work at the three holes not used to go over the spring pins, thus securely holding the formed plate to the work. We next clamp the formed plate on the curved post by tightening screw G against collar H. Spring-pins C, which heretofore were loose, are now locked by screws J, thus the whole arrangement balances well, one unit against another, making a very substantial holding fixture. The pin K keeps the curved post in an upright position while the base of the fixture is clamped to the table of the machine in the usual manner.

This operation is somewhat different than the usual run of profile milling inasmuch as but one spindle of the machine is used without the customary guide pin, the cutter shank being so made as to guide on the formed plate of the fixture.

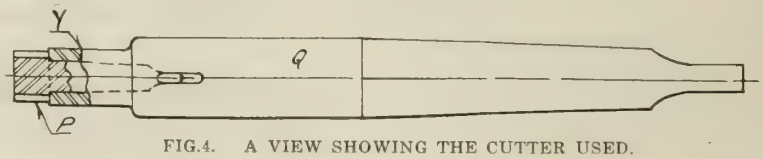

FIG.4. A VIEW SHOWING THE CUTTER USED.

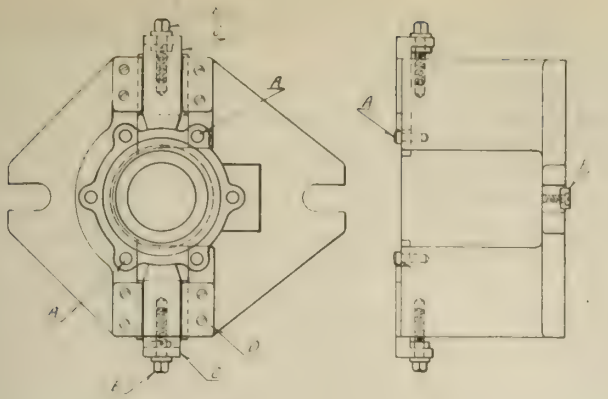

FIG. 2. DETAILS OF TURNING FIXTURE.

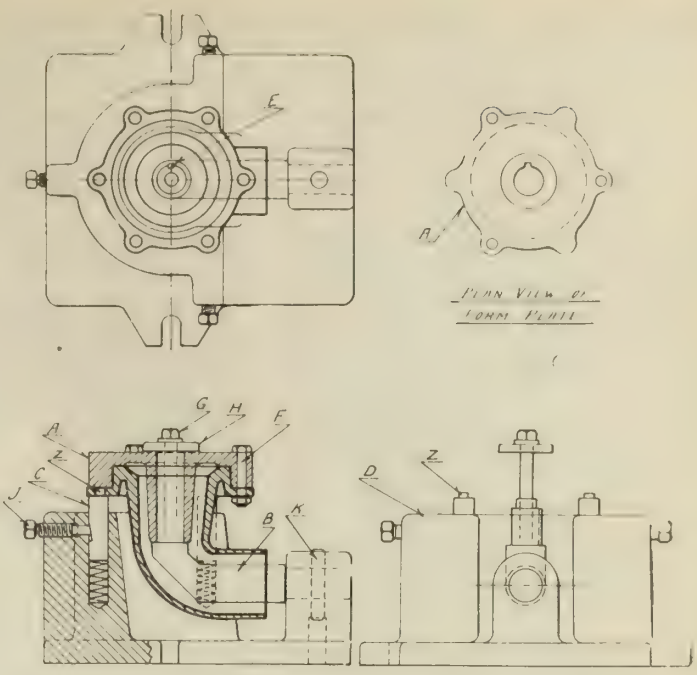

FIG. 3. DETAILS OF PROFILE MILLING FIXTURE.

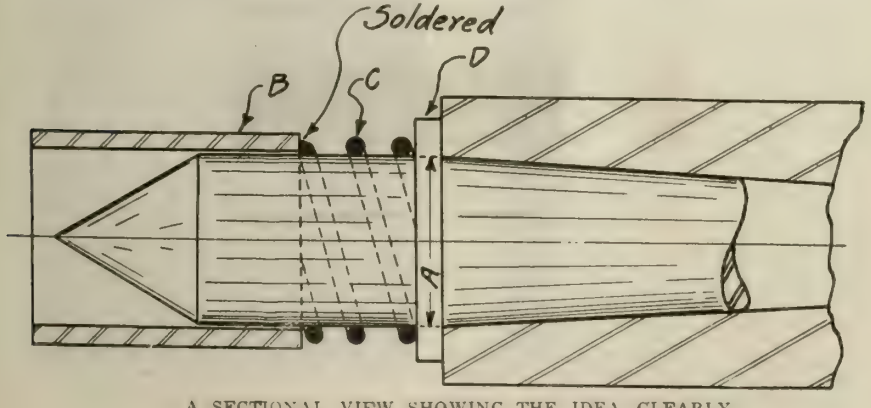
Referring to Fig. 4, the cutter proper P is of the type which is sharpened by grinding on the face of the teeth; this is tongued into the shank Q. The portion of the shank Y is held in contact with the formed plate while the cutter is revolving and milling the outline of the work, the desired contact with the formed plate being maintained at all times by the operator feeding the two handles of machine simultaneously, causing the table to travel in a transverse and longitudinal direction just sufficient to provite a good cutting action.

This entire tooling arrangement is one in which variety and novel construction are combined in set-ups on standard machines to produce a high-class interchangeable product in a very proficient manner, leaving very little to chance.

PROTECTING THE LATHE CENTRE

By Harrison Jenkins

No doubt readers in general will agree with the writer when he mentions that in operating a lathe it is an annoying thing to find that as you are placing the work in the chuck, your arm or elbow comes in contact with the sharp point of the tailstock centre.



Lathe operators in particular no doubt have experienced like trouble, yet any danger (for such it is) can be easily avoided and overcome if one takes the time to discover some little idea to eliminate the bugbear, and the following idea, though very simple, certainly overcame the trouble already discussed.

The writer merely made a centre with a straight portion, A, on which he slipped a piece of pipe, B. He then soldered a small spring, C, to one end of this pipe as shown. The washer, D, was merely placed in its position, so that the wear would come on the washer and not on the tailstock sleeve.

The idea itself is, of course, obvious, for when not in use the pipe protects the sharp point of the centre, yet when required for use, the tube easily slips back on the pressure of the work being applied.

DRILLS AND STRAIGHT HIGH-SPEED TOOLS

High-speed tools, such as drills and other straight tools, should be welded by the electric butt process and in no other way. Before welding, the two ends to be joined should be planed off instead of being ground. When ground, the ends have a tendency not to join properly and the result is that an oxide forms in the weld, which invariably results in breakage when the weld is made. When welded the tool should be placed in an annealing pot filled with hot sand. When the pot is full it should be placed in an oven and brought to a temperature of 1,500 deg. Fahr. and allowed to remain in the oven at this temperature for three hours, after which the heat should be turned off and the pot allowed to remain in the oven until the tools are absolutely cold. The tools are then ready to have the burr, caused by the compression in the butt welding machine, ground off or turned off. Under no circumstances should this burr be removed prior to the heat treating process. A Western tool manufacturer, who has turned out in 1919 more than a million dollars' worth of these tools, follows this process, and the failures of his tools are so rare and infrequent as to be almost negligible. In this same plant, 700 very heavy tools were recently welded by the electric butt process and, instead of turning up the end to be united, they were ground. In the inspection room these tools were subjected to a drop test. The inspector drops the tool from the height of his waist line on to two blocks placed on the floor in such a manner that the respective ends of the tool are caught, thereby subjecting the welded portion of the tool to a sudden shock. In the case of these 700 tools, every one of them broke in the weld. This may seem like a very simple point, but it is one which the welder should not disregard.—"Welding Engineer."

A SECTIONAL VIEW SHOWING THE IDEA CLEARLY.

A British metallurgist believes he has re-discovered the secret of the ancient Spanish armorers in producing a tarnish proof steel that even resists acids.

Do You Believe in Keeping Tab on Your Products

If You Feel Your Production Costs Excessive, Read This Article. It Illustrates Clearly How One Particular Firm Stopped Their Production Leaks, in a Definite and Simple Manner

By J. H. MOORE, Associate Editor Canadian Machinery

PERHAPS readers will have heard the story of the Irishman living in New York, who sent passage money to a fellow-countryman to come over and see the sights in the great and wonderful American city. The story has it that in due course of time the new son of Old Erin arrived at Gotham, and stepped off the gangway, where he was greeted by his old-time friend.

After the usual comments had been passed the newcomer remarked, "Say, Pat, there's one thing I clean forgot to ask you about. Is there such a thing as a system of Government practised here?"

"Sure," said Pat.

"Well, then," said the visitor, "I'll tell you right off the reel, I'm agin it—no system for me, at all, at all."

It may be a large-sized jump from such a story to the machine tool industry, but just as this Irishman had no use for system in the Government of a country, there are men in the machine tool game to-day who have no use for system of any kind in the shop or office.

Luckily, this breed is dying out, so we can safely assume that the majority of readers of CANADIAN MACHINERY are in favor of any rational system being adopted in a plant that will tend toward lower costs and greater production.

Any system to be a success must be based on a common sense fact, so if we are chasing the bugbear high cost, we must first find out the cause for the bugbear making his appearance. When we speak of leaks in a shop, we do not necessarily infer that some of the water pipes are burst, but that through some fault in the management, a little efficiency drops out here and there, which takes away from the production, and increases the cost of the product. Stop these drops completely and you have perfect management, but as such a condition is impossible, the next best thing to do is stop as many of the leaks as possible.

A plumber, before fixing any leaks, would first find out where the leaks are. He might adopt the policy of starting at the flooded portion, and try to trace from the various streams leading to the large flood the location of the different leaks. This policy is also adaptable in the machine business, but must be tackled in a rather different manner. You might look on the flooded portion, namely, the unsatisfactory result, showing the high cost of the product, and attempt to trace back to the various sources of trouble, but unlike the plumber's case (where water leaves its mark), inefficiency does not always leave so plain a trail.

One cannot gaze at a firm which has just failed, or landed into a quagmire of inefficiency, and tell in a short time all the reasons for the sorry state of affairs. The plumber can trace his leaks quickly, but, in many cases, it re-

quires considerable ingenuity to follow out the whys and wherefores of plant leaks.

An Example

Take for example a case the writer has in mind:

A certain firm were turning out varied lines of machine tools, and while making a reasonable profit, they felt they were not getting the money out of the concern that they should, so decided to investigate the trouble.

Operation by operation, they went through their production system, and apart from a very few changes, found that not only was their product being produced economically, but that the maximum point of production had been reached.

In spite of these points brought to light, the opinion still existed that somewhere there was a decided leak. Someone suggested that they watch the weight of their castings closely. This idea was poo-poohed as too trivial, but the originator of the suggestion stuck to his guns and pointed out that the very fact that all castings were made outside, offered a splendid opportunity for a leak in costs.

The records were looked up, and traced in each case back to the point where the various patterns had first been made. Imagine the surprise of those concerned to find out that in some cases over 185 pounds additional weight had been added to some castings. The average-sized piece on the various machines showed around 15 to 20 pounds difference. In the year's output this made an imposing figure, being away up in the thousands. Readers might be inclined to say, Why didn't they watch this item closer? But the pitfall was a mighty easy one to fall into.

Here, in brief, was the system first adopted: When a new pattern was made for any machine, the fact was duly noted on a card with the proper date, price of pattern, what used for, and so on. As a last item on the card, the weight of the first casting produced from the pattern was also recorded.

From these various figures the net weight of the complete machine was figured.

Take for example the case of a milling machine. A machine of such nature has a certain number of grey iron castings, steel castings, brass castings, etc., etc. From each pattern card the weight of the piece was noted, marked on a totalling list and added together.

All steel parts, cold rolled, machine steel, and so on, were kept track of on other cards, and the weight marked on the cards. These in turn were totalled. In this way the office could tell how much grey iron, brass, steel, etc., etc., was in a milling machine of a certain type. When we say they could tell the weights, we speak from a theoretical standpoint. Perhaps it would be best to say, "they thought they could tell."

No allowance was made for variation, and, strange to say, the profits were figured on a basis as follows: We supply so much material at so much a pound, which means so much cost. Our labor cost is a certain amount, therefore adding the cost of material to the labor cost, plus overhead expense, makes a certain total.

We receive for our machine so much, and taking away the total previously figured, leaves us with a total of so much. So stated before, they were making a profit even in spite of the leak, but the difference discovered in the weights added a considerable amount to their turnover.

What was the matter with the first system? Personally, we believe it was not based on practical grounds, but altogether on theoretical ideas. No allowance was made for the fact that a pattern, when new, makes a cleaner casting, each wall being of the thickness that the designer intended, or, at least, somewhere near it. As time goes on the pattern gets rapped around, and the core box, as usual, receives anything but kind treatment.

It would seem that coremakers in general have but one ambition in life, viz., to file, file, file, at a core, until it is much smaller than intended. Of course, the pattern has been well rapped, with the result that the casting produced, carries walls, perhaps ¼ in. thicker all around than intended, and up goes the weight. To those readers who may imagine these statements as exaggerated, we would suggest they get in touch with some designer of machinery and ask his opinion. Ten chances to one, he will answer in this way: "Well—I'll leave the answer to your own judgment, but when I want a wall ⅞ in. thick I usually state ¾ in., or even ⅝ in. on my patternmaker's drawings." This answer will, no doubt, convince, and you will leave him with a peculiar look in your eye.

To conclude this article, which is not intended as a guide to leaks, or how to find them, but merely a means of quoting the one case described, let us see how this firm kept track of their product after the alarming discovery.

Naturally, they were not going to be caught again in the same trap. The first step was a trip to the foundry, where a battle royal was enacted. Threats of the withdrawal of their work, with counter threats of "We should worry" took place, before common sense prompted serious consideration to the problem.

After Old Man Common Sense got a strangle hold on the proceedings, things went much better.

Where the foundry was at fault, they admitted their guilt, while no better results could be turned out with certain existing patterns, these were either fixed up or scrapped, and if scrapped, replaced by new ones. Each pattern got a thorough inspection, which gave the new-system-to-be a fair start.

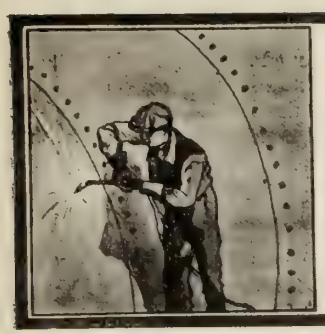
Specification sheets similar to the illustration shown were printed on thin, but tought) paper. These sheets were, of course, transparent and somewhat after the style of tracing linen. The original sheets never left the drawing office, being filed as if they were actual working drawings. Each type of machine had a set of sheets, each set subdivided into the different materials used.

The first item to be marked on the sheet was the type of machine, also the particular parts to which the sheet referred.

Then came the number of the sheet, and the number of sheets complete to the set. The other items illustrated at the top portion of the sheet were added later, as we will explain.

Now came the task of filling out the lower spaces. The order number, pattern, price, or forging number; name of piece, material, diameter and length, (if the piece was not a casting), and the number required. Last came the weight of one piece in the rough.

A blueprint was now made of the sheets, and the proper order number, number of machines going through on the order, the date, and the proper department, were all marked at the top portion. Readers can readily understand that all black parts shown on the illustration came out white on the blueprint.



In the lower portion of sheet, the progress of each piece was carefully watched. First, the quantity in the storeroom was noted, both rough and finished material. Next, the various operations were ticked off in the order through which the pieces passed. The last space marked memo, was for any special note of interest that the clerk wished to make.

While the explaining of this system may sound intricate, it is the very reverse, and mighty easy to keep up-to-date, once it is started. As every order number is completed, a new set of blueprints are used, and the old ones either filed for future reference, or thrown away, as desired.

The progress of the work can be told at a glance. It can be immediately noticed what particular operation is holding up the work, and this condition remedied. While we have used the sheet as an example for keeping tab on a milling machine's progress, it is equally adaptable to other classes of work, and can be safely recommended to those not already familiar with its use.

Chicago inventors have patented an L-shaped private garage to hold two automobiles, either of which can use a single door that extends across the angle.

For removing water from submerged ships a motor driven pump has been invented that can be operated at depths beyond the capacity of steam pumps.

WELDING AND CUTTING

NEW HAZARDS IN ELECTRIC-ARC WELDING*

By ALFRED W. JANSEN

THE adoption of electric-arc welding in the shipbuilding industry as a substitute for riveting has presented new dangers to workmen, which, under some conditions, are unusually hazardous. Care has been taken for the eye, for in recent years the dangers from this intense light have been studied by specialists and adequate protection has been given. But the harmful effects of these light rays upon the tissues of the human body has had little attention. How to protect the workman from this hazard is more easily solved when the cause of the intensity of the light ray is known under all conditions.

The complete spectrum usually presented in the process of electric-arc welding is composed of the visible, the ultra-violet, and the infra-red rays. The ultra-violet and the infra-red, the invisible rays, are those harmful to the exposed tissues of the body. The intensity of the invisible rays is determined by the temperature of the arc and by the surroundings, which may either reflect or absorb the light. While it has been known that painful body-burns have followed exposure to these extreme light rays, it has not been determined whether they are caused by the ultra-violet or the rays in that point of the spectrum where the X-ray is found. The infra-red rays are not the cause, for while they have an irritating effect and are rather uncomfortable and fatiguing, they are not especially dangerous.

There are no great hazards in arc welding done in the open, in shops, or in places where special screens may be erected to protect the welder and those near by. They have not been serious in confined places such as boilers, where the surroundings have absorbed some of the intensity of the light and not reflected it. But on board ship, in compartments where the working space is hardly large enough for two men to be employed at the same time, and where the entire surroundings have been covered with red lead, the dangers of the light rays seem to be greatly increased.

Not long ago, electric-arc welding was used aboard a large steel ship under construction, in a compartment as described above. The welder had worked with the same apparatus for some time under ordinary conditions and had not experienced any burns on the exposed parts of his body. Within a few hours the man complained of burns on his neck and chest. A close examination of the skin showed it to be dried up and cracked, like an old piece of china, on which the glazing has become crazed. Added to this the skin was slightly inflamed and was deeper in color on the right side of the neck. Here there was a spot about the size of an egg which seemed to have been subjected to more exposure than other parts of the body. There was a little tinge of blue on the inflamed spot which looked like a burn caused by the X-ray. It was decided that this was due to the improper adjustment of the face-mask, which caused constant exposure to the direct rays. The burns on the back of the neck were apparently caused by the intensified rays reflected from the red lead.

After four days the burned condition healed sufficiently to permit further experiments to determine the cause of this unusual condition. The welder was supplied with a linen bandage lined with lead foil, which he wore as a collar to protect the entire neck. As ultra-violet rays will not pass through lead, and as no further burns appeared, it was decided that the ultra-violet rays were the cause of the trouble. As the welder had worked with the same apparatus under other surroundings, it was concluded that the reflected rays from the surfaces painted with red lead were increasing the power of the harmful rays to such a degree as to cause painful burns. Such severe burns might even lead to cancer.

The next experiment was made by welding in a compartment that had not been red-leaded, and where the surfaces were of the natural metal color. The hazard in this case was very much reduced. As no special apparatus was available for measuring the intensity of the rays in the red-leaded compartment, it is not known whether the ultra-violet rays had reached that point in the spectrum scale where the X-ray is found. It seems, however, that the red lead had either the effect of absorbing the infra-red rays, and thereby intensifying the ultra-violet, or the red lead converted the infra-red to ultra-violet rays.

As in shipbuilding these working conditions in a compartment are common, and the burns are so intense, a necessary precaution is to have all of the welding done before the surrounding surfaces are red-leaded. This is the surest way of giving the workman maximum protection.

PRESSURE OF ACETYLENE IN WELDING INSTALLATIONS

The question of increasing the pressure of the acetylene gas oxy-acetylene installations has formed the subject of long discussions in the German technical papers during the war. It is a question that was given considerable attention by the Union de la Soudure Autogene some months before the outbreak of war.

Acetylene installations have been proposed and even constructed—in Germany especially—in which the acetylene gas, after leaving the purifier, has been compressed by means of a small automatic compressor into the service piping at a pressure of 3 to 4 pounds per square inch. A storage tank serves as a reservoir and regulator.

On the other hand acetylene generators have been developed in the United States which generate and supply the gas up to a pressure of one atmosphere. A French company have for a long period constructed generators producing gas of a pressure of about 2½ pounds per square inhc.

It is natural to ask, in view of the tendencies to use increased pressures, at what pressures the acetylene should reach the blowpipe. A little reflection and a few experiments lead to a very clear solution of this problem.

The blowpipes which utilize dissolved acetylene, amongst the earliest to be used, always give excellent results. Very rarely is there a return of flame or detonations, whilst the consumption practically agrees with what is considered the ideal, namely equal volumes of oxygen and acetylene. Further, the two gases enter the blowpipe at almost the same pressure, which, in comparison to other blowpipes, is high for the acetylene and low for the oxygen.

Blowpipes utilizing acetylene produced direct from generators were designed after those for use with dissolved acetylene. The oxygen being used to obtain the necessary velocity, of flow, the construction was much more difficult, and for many years this type of blowpipe gave results distinctly inferior to those obtained with dissolved acetylene. To the success of dissolved acetylene may be traced the idea of utilizing the acetylene at a pressure much higher than that given by the ordinary type of generator. It was considered that this was the most important factor for the good working of blowpipes.

But the construction of low pressure

blowpipes has made great progress during the past ten or twelve years. Blowpipes have been placed on the market which aspirate the acetylene with much lower pressures of oxygen and at the same time obtain a more perfect mixing of the two gases. The return of the flame has almost been overcome, whilst the proportion of oxygen to acetylene consumed in the blowpipe has been reduced from 1-5 or 1-6 to 1-3 or 1-2, and even lower. In a way one can say that with a well designed low-pressure blowpipe the results obtained are practically equivalent to the dissolved acetylene blowpipe.

The question of the pressure of acetylene is always cropping up, but less than in previous times. In many cases it is only necessary to very slightly increase the pressure by simply loading the gas holder for example, for obtaining more satisfactory results with a particular make of blowpipe. The French Association have shown that a pressure of 8 to 10 inches of water is practically sufficient with good blowpipes using pure acetylene.

The use of dissolved acetylene has advantages of simplicity and convenience which are incontestable, but it is useless to attempt to follow its path with generator practice which give entirely different and sometimes dangerous conditions.

It is preferable, where increased pressure is required, to use, say a medium pressure generator on the lines of the French Company in which the pressure does not exceed four pounds per square inch.

To repeat, it is possible to obtain just as good results with good modern low-pressure blowpipes supplied from a well-designed low-pressure generator with acetylene at a pressure of 8 to 10 inches of water. The service piping being designed so that at a maximum consumption the loss of pressure does not exceed ⅛ inch, and where the hydraulic back pressure does not absorb more than 2 inches of pressure.

It is necessary to note that these remarks refer to the present, but it is clear that blowpipes have not reached their ultimate perfection. One can forecast, however, from the above remarks, that, on the grounds of efficiency and economy the replacement of low pressure generators by installations working at a high pressure, the day is far distant.—"Acetylene & Welding Journal."

INDUSTRIAL SAFETY CODES AND THE AMERICAN ENGINEERING STANDARDS COMMITTEE

The Bureau of Standards in Washington held a notable conference on industrial safety codes, at which there were representatives of practically all organizations of a national scope interested in any of these wide phases of industrial safety.

There was a thorough discussion of the whole situation, the consensus of opinion being that there should be a large number of industrial safety codes —perhaps 50 or even 100—developed during the next few years.

The subject is a very far-reaching one. Not only are vast financial and industrial interests involved, but it is said that the welfare of more than six million workers is directly involved in the work of a single organization, the National Safety Council.

The conference unanimously voted that the preparation of all such safety codes should be under the auspices and rules of procedure of the American Engineering Standards Committee. In accordance with the recommendation of the conference, the American Engineering Standards Committee requested the International Association of Industrial Accidents Board and Commissions, the Bureau of Standards, and the National Safety Council to organize a joint committee on safety codes, this committee to include representatives of these bodies, and such others as they may consider advisable, with the understanding:

(a) That this joint committee shall report upon safety codes required, priority of consideration of the codes, and sponsor bodies for their preparation.

(b) That the joint committee be requested to make a progress report by February 1, 1920.

In compliance with this request of the Standards Committee, the three bodies have organized certain committees to carry on the work. These included some of the best known business and safety men in the country.

It is planned to add two more members to the committee, one each from the Ohio and the California commissions.

The committee held its first meeting in Washington on January 9, at which time tentative recommendations were formulated for some thirty safety codes. This committee, which represents in its own personnel a large range of interests, is actively at work. It is consulting a large number of other interests involved. Rapid progress is being made, and it is expected that the committee will be able to render an important preliminary report in the near future.

A new French material for waterproofing leather, cloth, paper, and other materials, is described in a recent issue of the "Chemical Trades Journal." It consists of a mixture of eight parts of amyl acetate and four of castor oil, with one part of sulphur chloride stirred into it. Though this forms a jelly, giving off hydrochloric acid, it liquefies after being kept tightly covered a few days, and, the acid being then neutralized with barium carbonate, gives a colorless solution on filtering. To make a varnish, nitrocellulose is dissolved in the liquid after the addition of alcohol or benzine.

In the Paris observatory clocks are kept 90 feet under ground, where the temperature has varied less than one degree in several years.

WHAT MAKES GOOD INSPECTION*

By Lew R. Palmer

Quite properly tact has been given first place in consideration of the subject of Good Inspection. An inspector may have education, practical experience and ability, but unless he has tact he lacks the main essential of a good inspector.

Those of us who have done pioneer safety work learned at the outset that promoting safety was largely a matter of salesmanship, and a good salesman cannot be successful unless he is tactful. Safety must be sold from the top to the bottom—to the management and to the workmen.

I recall a discussion between a Pennsylvania factory inspector and a steel mill safety inspector, where the factory inspector could not understand how a certain division of a large steel plant had made such improvement in safeguarding and in accident prevention. According to the State inspector, he had never ordered a single safeguard installed but that, the man in charge of the division claimed, it would "surely shut down the mill if installed." The plant safety inspector on the other hand said it was very simple to secure the installation of guards.

The plant inspector knew his man. He knew that he was an enthusiastic baseball fan, and in most cases the interview started with a discussion of the latest achievements of the local prospective pennant winner. Eventually, some of the accidents occurring in other departments would be discussed. The good records that had been made through team work in some rival mill or department would be commented upon, and the sporting blood of the superintendent in question would soon begin to circulate. Before the safety inspector had left the mill one or more of the safeguards he had gone down to the mill to have installed had been recommended by the superintendent himself. In most instances it is far easier to get people to do things because they want to than because they have to. In the case of the plant inspector the safeguard was installed in a remarkably short time, and woe be unto the foreman or workman responsible should the guard not be maintained in place.

It can be truthfully said of Faith, Hope and Tact, the greatest of these is Tact.

The welder should learn to weld quickly, using the largest tip consistent with the job. It is much the same as using a hammer. If a machinist has small work to do he chooses a light hammer for any hammering required, but if the job is heavy, and he knows his business, he will use a heavy hammer. Less distortion will be produced in welding with as large a tip as the job will stand than would result if a small tip were employed. Less gas and less time also will be required, and the job will be sounder throughout.

*From an address before the Fourth Industrial Safety Congress of New York State.

WHAT OUR READERS THINK AND DO

THIS MAN BELIEVES THAT STRATEGY IS NOT CONFINED TO WAR ALONE

Editor, CANADIAN MACHINERY: The topic recently opened for discussion relating to the opportunities for the ambitious worker, is one which I suppose has given every live mechanic something to reflect upon. To me it seems as though most of the shops are full of "Industrial Jeremiahs" sitting as it were under their respective juniper trees and bewailing their fate with respect to their calling in the field of industry.

Assuming that we are to deal with the situation as we find it in Canada, let me proceed to give my views of the Canadian executive in general. The field is crowded with ambitious men, more so to-day than ever before. There is a continual striving for position as leaders of men in religion, politics, both municipal and general, and even in the smallest machine shop. Our friend H. H. J. in his recent article appears to be looking at the question simply from the standpoint of mechanical proficiency. If Mr. H. H. J. imagines for one brief moment that, by being the best mechanic he is qualified for the biggest position, some day he will wake up with a bunch of new ideas in his head. Usually the best worker is found "working." On the other hand, to state things plainly, so to speak, the boss's job is a good deal a matter of politics. Besides his worries in connection with his everyday duties he has constantly before him the spectre coming up from beneath of the individual who can fill his position better than himself, and above him the haunting supervision of superiors who have mentally resolved that so far up the ladder he shall go and no farther. In other words it is up to himself to hold himself up and also keep climbing. If, as the old adage has it, "there are tricks in every trade," then the business of being a boss is a whole bag of tricks, and no two of them alike. In fact the business is an art and the main art is to conceal art. Probably a little anecdote will throw some light on the subject and help our friend to see things from a standpoint other than mechanical efficiency. Seeing that the incident I am about to relate happened so long ago, and the gentleman in question always has such a multitude of schemes on hand, he will naturally be too engrossed to recognize this narrative even should he happen to read it, so here it is: "A man there was who climbed to the eminence of tool-room foreman through the power of his tongue. Albeit, somehow or other he got into such a state of affairs that his job looked to be worth about two cents judging the time he would last, considering his rate of pay. However, this one was a wise bird, and, on being called into the office one morning to receive a reprimand he resorted to the following trick, thereby showing great presence of mind. Seeing no other way out of his awkward position he very realistically broke down and wept like a child, and proceeded to inform the management that it was nervous exhaustion caused by too much application to business and he would be forced to take a rest and see a physician. Of course his doctor naturally sympathized with him and ordered up his much-desired 'rest cure,' and all our friend had to do was to go back and collect sympathy from the management. Being a married man he thought the most effective way was to bring his little daughter down to the works daily for a few minutes, and he himself tried to look anxious by wearing a very sad expression. Needless to say the management fell for this stuff fine. However, it is only a matter of time until his schemes get stale and he will be tumbled." This of course may be rather an extreme case of diplomacy, but it certainly is scheming that puts a great many executives into positions. Probably our friend, by using the foregoing hints in conjunction with his mechanical ability, will begin to climb, and if he does I would very like to hear his revised views in the columns of CANADIAN MACHINERY at some future date.

WILLIAM ERNEST.

HERE'S THE CASE AS IT APPEARS FROM THE ANGLE OF THE FOREMAN

I REMEMBER reading a statement in CANADIAN MACHINERY some time ago, of a certain foreman or superintendent, who had worked very hard during the war, on being asked what he intended to do after the war he answered that he would take a job as an ordinary machinist and work with the boys to recuperate. This is the failing of a good many foremen, as they get all the kicks and few of the halfpence. They have to take responsibility of the work turned out by every man.

Many a time the workman is confronted with a problem which taxes or perhaps overtaxes his mechanical ability, and he goes to the foreman for instruction. The foreman is expected to hand out a snap decision which is perfectly sound in every respect. If it develops later that Bill or Tom has been able to improve on the foreman's original suggestion, it does not by any means follow that Bill or Tom ought to have the foreman's position.

The ideal foreman ought to be the best mechanic in the shop and know how to handle men and boys. That means being a good character reader; also he should be a good business man. It must be borne in mind that the foreman is not running an educational institution but a business concern, of which he must make a commercial success, and his success is measured in dollars and cents profit to the firm. If his department was running at a loss he would soon be called upon to give the reason why. Knowing this to be the case, can a foreman be blamed for not moving an expert lathe hand to the bench at which, as yet, he has had no experience, and put a green hand on the lathe just for the pleasure of instructing them both? The occasions when foremen deliberately keep a good man back for fear he should prove more capable than himself are very rare. If the man has got the initiative no foreman on earth can prevent him from rising in his profession. When I take a mental review of all the foremen I know, I can count more than 95 per cent. that have risen from the ranks, and in many cases were assisted and recommended by the foremen they worked under.

Most working men consider things from a purely selfish viewpoint and do not consider the problems of the foreman at all. He is the legitimate goat for all the troubles that occur. He has to face the music in the office, and gets it in the back from the men. He gets it both coming and going. If the men can put one over on the foreman they think they have done something to boast of. (I have no doubt many foremen could write some good stories on putting one over on the boss.)

Now what is the remedy for this state of affairs? It seems to me that we

should try to see things from the other man's viewpoint, that the firm should appoint a mechanical instructor, and the apprentice should be looked upon as a liability or a responsibility and not as an asset to be handed over to the foreman to make a profit on. On the other hand the apprentice should stay with the firm long enough to reimburse them for the expense he has put them to.

Most firms are willing to consider the suggestions of their employees and pay them for any idea they adopt, but usually the payment does not begin to represent the money saved to the firm because the firm certainly won't adopt the suggestion unless it is a money saver.

I guess this letter is long enough so I will conclude by suggesting that we all learn that immortal poem of Bobby Burns, "Wad some power the giftie gie us to see oorsel's as ithers see us. It wad frae mony a blunder free us, and foolish notion."

A. FOREMAN.

GRAPHIC DIVISION, A TIME SAVING DEVICE

JOHN S. WATTS

The method used to divide a line into a given number of equal parts, by graphic arithmetic, is undoubtedly well known to draftsmen, but the knowledge of it is not applied as much as it might be to save time in laying out work on the board.

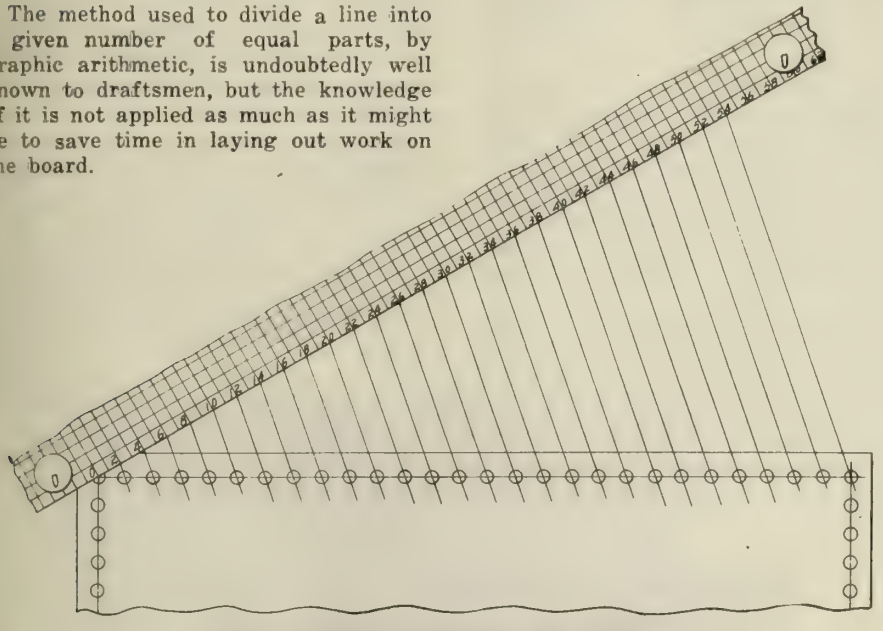

CHART SHOWING THE IDEA DESCRIBED

In the numerous cases in drafting room work, where it is necessary to divide a line into a comparatively large number of parts, such as in showing the rivets in a boiler plate, or in structural work, etc., the wrinkle shown in the sketch accompanying this article is a great time saver, and is conducive to more accurate and neater work than the time-honored way of stepping off with dividers.

The idea is simply to have a narrow strip of squared paper of sufficient length always at hand. Its usefulness is greatly enhanced by numbering the spaces, somewhat on the lines of the one shown in the sketch.

We will suppose that the plate shown is to be divided into 27 spaces, and as 27 spaces of the squared strip is rather too much smaller than the line to be divided, we will, for convenience, take 54 spaces on the strip and use only every second division.

The procedure, now, is to pin the strip on the board, as shown, i.e., with the edge of the strip (at the division line marked "o") exactly intersecting the end of the line to be divided. The other end of the strip can be pinned down on the board at any convenient place.

Now join point 54 (because we want 27 spaces, but are taking 2 spaces on the strip, and $27 \times 2 = 54$), to the outer end of the line to be divided, and with parallel ruler, or two triangles, draw lines parallel to the first line, and the 27 spaces will be accurately and quicky found.

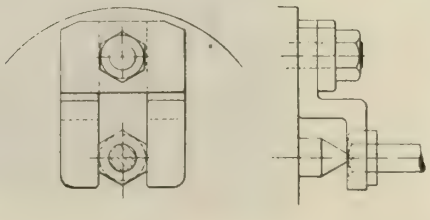
In actual work the lines would not be drawn, only marks need be made on the line to be divided. And where the line was not too long, a sheet of squared tracing paper could be used, and the points pricked through directly onto the line without having to use triangles.

REMOVABLE DEFLECTOR BLADES FOR B.&S. GAS HEATER

By F. Horner

The Brown & Sharpe gas heater, with steel blades to deflect the flame into a flat shape suitable for heating pieces quickly for tempering, is often inconvenient for other purposes, such as local heating with the point of the flame, and some kinds of blowpipe soldering operations. The sketch offers a suggestion for modifying the construction so as to leave the burner available as an ordinary one for such functions. Un-rivet the blades from the burner tube itself, and re-rivet them onto a short piece of tubing sufficiently large to slide down over the burner tube. The short piece may be split through, as shown, to afford a spring clamp, so that the fitting will not slip round.

"WHAT SHALL I MAKE?



By Donald A. Hampson

A good many mechanics, fired with a desire to go into business on a small basis, have asked themselves that question. One answer may be found in the crying need of the automobile repair business. "An expansion reamer in sizes from ⅝ inch up." There is not a garage in the land that wouldn't buy from one to a dozen of these tools that are more useful to them than a lathe or a press, yet dealers cannot supply them, and catalogues do not show any except in sizes much too large for automobile work.

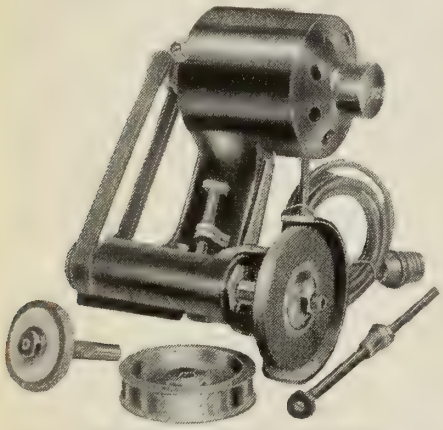
An elephant without tusks seems almost impossible, yet in Ceylon the male elephants have no tusks at all; they have miserable little grubbers projecting two or three inches from the upper jaw and inclining downwards.

ADJUSTABLE BOLT DOG

By F. Horner.

In place of the ordinary solid bolt dog, the sketch offers an alternative in the way of a divided construction, the halves being set and clamped to suit the size of bolt head to be driven. A stout clamping-plate is laid over the tail ends of the halves, and pulled down on them; serrations may be cut on the meeting surfaces to assist in preventing skidding.

DEVELOPMENTS IN SHOP EQUIPMENT



COMBINATION GRINDER

The National Machine Tool Co., Racine, Wis., have placed on the market what is known as their combination tool, cutter and gauge grinding machine.

This machine has been designed for any kind of grinding performed in the tool room or machine shop. It has a motor placed over the spindle, which makes it possible to grind cutters, arbors, reamers, mandrils, etc., between centres, on either a large or small lathe.

When using the grinder on lathe, planer, shaper, or milling machine, the motor is always out of the way, allowing the grinding wheel to be used right down to the limit.

GENERAL VIEW OF GRINDER

The grinding arbor has a hollow spindle like a lathe or screw machine, with a collet to hold 5-16 bar for internal grinder. This feature makes the internal grinder adjustable, and can be let out to suit the nature of your work.

This style machine can also be used for lapping small dies, bushings, and any kind of work usually performed in a lapping machine. It can be used in the shaper for many purposes, including the making of snap gauges, while by placing on a large wheel you can accomplish surface grinding.

As the name implies this machine is a combination grinder, and has been designed with the object of relieving the tying up of other machines. By its use, work which formerly was accomplished on lathes and other machines can be readily done on this grinder.

The main bearings operate on balls, and the wheel moves over the work, instead of moving the work over the base of the machine. The complete weight is only 50 lbs., which makes it easily portable.

LAFAYETTE GRINDER

The Lafayette Tool & Equipment Co., 21 S. 12th St., Philadelphia, Pa., has recently placed on the market a universal grinder for precision tool-room work. This machine is illustrated in Fig. 1 and Fig. 2. While one of its most obvious applications is on a tool-room lathe for both internal and external thread gauge grinding, this machine is also intended as a grinding machine when used on the bench, and as a grinding attachment to be applied to lathes, milling machines, shapers, planers, etc., to handle a variety of work. The grinding wheel spindle bearing housing has a longitudinal movement in a saddle, which in turn has a vertical movement on the column. A swivel is provided with a protractor of a large radius for inclining the grinding wheel spindle, when thread grinding, to suit the helix angle. Micrometer dials are provided for both longitudinal and vertical adjustments, making it very convenient to obtain accurate settings whenever required for precision work.

Realizing the importance of service rendered by the spindle construction in any precision grinder running at 25,000 revolutions per minute, which is required to produce work that is accurate to within 0.0001 inch, the manufacturers have developed a style of spindle which they claim to be entirely free from vibration, even under the most severe working conditions, and one which will produce an unusually smooth finish. The spindle is made of a special analysis steel, hardened and ground, and the bearings are of Non-Gran bronze, lubricated from a reservoir of oil, and protected against oil leakage, dirt and grit by felt washers. The bearings are tapered and readily adjustable for wear. The driving shaft is independent of the grinding wheel spindle, preventing transmission of pull from the driving belt and allowing the wheel perfect freedom of operation. Adjustment is provided for belt tension, and the grinding wheel has downward action, so there is no danger to the eyes of the operator. A General Electric universal motor is furnished, which can operate from any 110-volt circuit, whether direct or alternating current.

Means are provided for trueing the grinding wheel that make this machine very suitable for thread gauge grinding, as well as for general purposes. The wheel trueing device is designed to accommodate three diamonds, and graduations at the base of the trueing device permit of setting it at any angle. Adjustable stops, as well as means for locking, are provided, and the trueing device bracket is adjustable vertically in reference to the column to secure proper alignment. It will be noted that, when thread grinding, the wheel is trued in the horizontal plane of the centre line of the work and lathe spindle. It

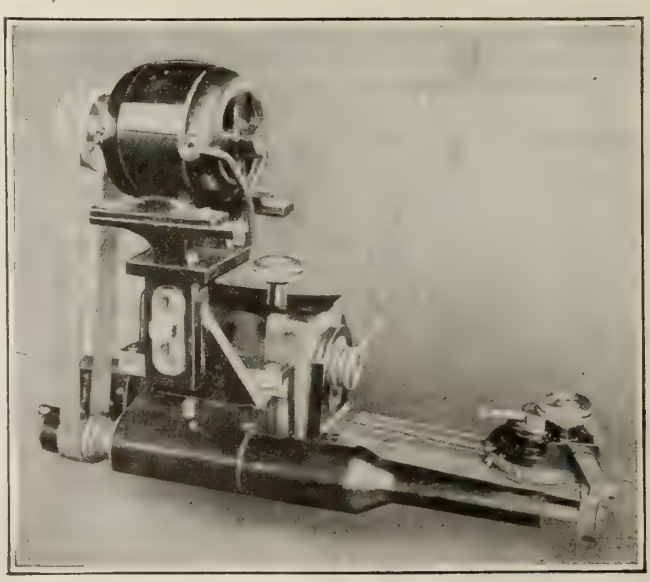


FIG. 1. LAFAYETTE UNIVERSAL GRINDER EQUIPPED FOR HANDLING INTERNAL WORK.

sometimes happens, particularly when grinding internal threads, that there is no room for the trueing attachment when actually grinding. An adjustable stop is furnished which enables the trueing device bracket to be rapidly attached to the column at the proper height. The bracket is quickly clamped to the column by a stud with an interrupted thread.

For grinding deep holes and long internal threads, the manufacturers have developed an extension spindle and an extension spindle bearing housing. The application of these features to the Lafayette universal grinder is illustrated in Fig. 1. Non-Gran bronze bearings are also used in the extension spindle bearing housing. When used together with a surface plate, this machine is very suitable for surface grinding. Fig. 2 shows the adaptation of the Lafayette universal grinder to the grinding of circular forming tools. With the use of other simple adapters, securing the work to the rack, this machine can be used for a variety of bench grinding. With the use of an extra rack holding device, it is not necessary to remove the work in order to true the wheel, and the diamonds are always in the correct position for trueing.

In addition to the specific uses referred to in the foregoing, this machine, when applied to a lathe, may be used for cylindrical, taper and internal grinding. Used with the relieving attachment on the lathe, taps, cutters, etc., are relieved by grinding after hardening. This grinder may be used for grinding cutters in position on the milling machine, and when clamped to the overarm of the milling machine, it may be used for surface grinding, or clamped vertically to the overarm bracket of the milling machine; it may be used for finishing dies of various kinds. The use of pencil grinding wheels is recommended for the grinding of dies. This machine may also be attached to shapers and planers, for surface grinding and a variety of other purposes. It will be readily seen that the machine is quite universal in character, and that its many applications make it possible to adapt it to a great many uses, either in tool-room or special work or in precision manufacturing processes.

KREMER CUMMINS BELT SHIFTER

A mechanical belt shifter for machine cone pulleys, extremely simple in design and efficient in operation, is being placed on the market by the Kremer Cummins Machine Co., 1833-1835 E. 55th St., Cleveland, Ohio.

It consists chiefly of a steel channel, having teeth machined along one edge, forming a rack. This rack is supported and held stationary by two drop forge pieces, one attached to each end of the channel, as the means of connection to the hanging bracket which forms part of its support.

No part of the shifter is applied directly to the machine too or countershaft. The upper belt-shifting carriage is mounted on the channel and operated by means of a sprocket or gear in mesh with the teeth of the rack. This carriage will move in either direction as desired by means of the operating handle provided for the purpose. A suitable loop surrounds the belt and slides on two rods extremely from one side of the carriage. This provides a positive means of shifting the upper portion of the belt. A step is provided on the channel by bending out any desired tooth of the rack. This prevents the belt from being thrown entirely off the cone pulley, should the shifting carriage be moved farther than the necessary amount. A length of pipe extending downward from the upper shifting carriage carries at its extreme end the lower shifting loop and operating handle. This part is placed close to the machine pulley and provides a suitable means for shifting the lower portion of the belt.

When the machine tool is equipped with safety guards, the handle of the last mentioned part may be made long enough to extend through a slot or opening made in the guard. This arrangement provides absolute protection to the operator.

In operating this device, the operator first shifts the belt to the next smallest step of the machine cone pulley by means of the operating handles. The two operating handles always assume the same position with each step of the machine cone pulley.

This belt shifter is inexpensive, easily installed, and gives a very practical method of changing the speeds of cone-driven machine tools.

Asbestos paper that has been used for protecting preheated castings and welded parts is a most excellent pack for annealing steel dies. It crumbles readily and forms a superior fireproof heat insulator, which cleans off easily and which may be used indefinitely.

Well—It All Depends

IT all depends on who does the thing or who says the thing.

Some weeks ago an item appeared that Hon. Ernest Drury, Premier of Ontario, had gone to a doctor and been vaccinated.

Well, what of it? Had it happened three months ago we would have heard nothing about it. Chances are that Mr. Drury would not have been vaccinated at all. If smallpox had come into his corner of Simcoe, he would have simply steered the old grey mare into Barrie or some other place decorated with some doctors, got his little scratch and departed. Would it get on the front page of the papers? Not much. No editor would have given a line to announce such an event.

But now that Mr. Drury has come into prominence, the thing changes. Folks who argue that vaccination is right, proper and good, stow that bit away and spring it as a real argument to bolster up their case.

Mr. Drury being vaccinated and Premier Drury being vaccinated are two largely separated occurrences.

Again. An ordinary individual comes along and tells us that we are spending too much money; that we have ceased to know what thrift means. He gets a scant hearing, and the chances are that just to show how wrong and warped his views are we blow in a few extra dollars that day.

But Lloyd George makes a statement on the need of national thrift. He points out where our present policy of spend much and save nothing is going to lead us to a stone wall.

Well, what happens? Folks take a strangle hold on the neck of their money bags. They begin to look each foolish thing in the eye, and grow enough courage to say "Scat!"

But it all depends on who says things or does things. Very often their size and importance depends entirely on the size and importance of the men tied up to them.

A Boat With a History

THE Powhattan, the big American transport that was towed into Halifax a few days ago after being tossed around off the coast for almost a fortnight, has had a rather interesting history.

She was formerly the Hamburg-American liner Hamburg, and prior to that the private yacht of one William Hohenzollern, the former German Emperor.

It was on the Powhattan that former Emperor William visited England in 1906. At this time he was reputed to have paid the Hamburg-American line $4,256 a day for the use of the liner, which was then known as the Hamburg.

Later the vessel was used to carry Theodore Roosevelt and his party to Europe in March, 1909, when he made his trip to Africa hunting big game. In 1914 the liner was chartered by the American Red Cross to take doctors and nurses to the European war zone, and made a number of trips in this capacity, under the Red Cross.

When the United States entered the war in 1917 the Red Cross was renamed Powhattan and placed in the transport service. The vessel carried thousands of soldiers to Europe and return without incident, beginning her last trip on September 23, 1919.

The U. S. Steel Corporation

PEOPLE are talking and thinking in terms of millions now. It was not many years ago that a millionaire was photographed and bowed to. Folks wondered how he took that much money away from the rest of the people.

In Canada we speak glibly of the millions we have raised in our war loans. We are thinking in sums away beyond and over our heads.

The United States Steel Corporation announces an increase in wages on February 1—rather a decent thing to do just after breaking the strike directed against it. Well this increase will amount to $24,000,000 a year, a sum equal to a five per cent. levy on the entire common stock.

Chances are that holders of common stock will not be called upon to put up this levy. The over-anxious public, now willing to pay premium and super-premium prices for steel, will see that that extra $24,000,000 is provided.

Now to get back to the question of millions again—this new increase makes the annual pay roll of the U.S. Steel Corporation more than $475,000,000 per year.

For an organization that has been assassinated and dissolved and dispersed and broken up several times each way by the Sherman anti-combiners, said Steel Corporation seems to be in fairly good health yet.

The ladies of Wiseville had met to discuss a way of meeting the H. C. L. Substitutes and the intricacies of the magic art of food preparation were thrashed out. One woman told of a dish she had prepared, which she declared her husband had eaten and pronounced good, which he would not have eaten had he known that its principal ingredient was something he had always refused.

One of the ladies drew a fine point as to deception.

"Well," said the other, "I suppose you hold that a man never deceives his wife."

"Oh, no, indeed!" she said. "I shouldn't go so far as that. How would it be possible for the average man to get a wife if he didn't deceive her?"

That was bad enough, but another of the ladies felt encouraged to say that she had met that day a young woman who had been employed by her. During the talk with her which she had, she noticed that the girl's face did not shine with the usual happy expression. She inquired: "Is your husband kind to you?"

"Oh, yes, he is; he is very kind. He is more like a friend than a husband."

Metric System is Now Under Hot Discussion

THESE are troublesome times in the United States, that is as far as the system of measurements are concerned. As readers perhaps already know, there is an organization known as the "World Trade Club," which has burst forth into song in favor of the metric system. This organization has flooded the country with letters and dope of all description in an attempt to prove the metric system as the one and only system, but so far its efforts have been nil, and has awakened responsible manufacturers in general to the danger of a compulsory metric system being adopted.

Following is the report of the committee on trade and commerce of Pittsburgh, Pa. This matter was addressed to the board of directors no later than January 23, 1920:

"Your committee on trade and commerce has given careful attention to the question of the adoption of the metric system of weights and measures as suggested in the report of your committee on suggestions and recommendations, which was referred to this committee for consideration.

"At the present time there is being conducted by an organization styling itself the 'World Trade Club,' with headquarters in San Francisco, an active campaign favoring immediate legislation to make compulsory the exclusive use of the metric system, and thousands of letters have been pouring into Washington from all parts of the country, with the result that a bill has been prepared for presentation to Congress. It is not at all clear who and what the World Trade Club may be, or from what source its evidently abundant finances are procured. It is certain, however, that the country is being flooded with a mass of literature quoting innumerable authorities on the subject. In a casual glance through one of the pamphlets we find the statement: that

> 'In the British Isles, however, currency not being decimal but divided into guineas, pounds, crowns, half-crowns, florins, half florins, shillings, half shillings, pence and farthings, etc."

"In this statement the effort to create sentiment against the sub-divisions has led to inaccuracy, inasmuch as the guinea has long been obsolete, and the half florin and half shilling never existed. It is possible that on examination, more inaccuracies would be found in the great mass of literature so lavishly distributed.

The metric system was legalized in 1866 by virtue of an Act of Congress. Thus, for over fifty years it has stood on a legal parity with the English system, and fully available to all who wished to use it. It is not therefore fair to say that if it cannot win on its own merits by voluntary adoption under the protection of this law it is not entitled to win under a law of force. The present attempt is to prohibit the use of the existing system and make the metric standard the one exclusive official system.

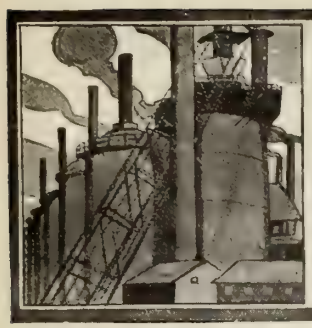
"At this time, when, as a result of the world war, production and commerce are in a chaotic condition, and when the whole world is hungry for the products of the two greatest nations whose commerce would bear the whole burden of this inopportune tampering with the fundamentals, it would be folly to make 'confusion worse confounded' by attempting any such radical change.

"It is and always has been the practice of Pittsburgh manufacturers to quote upon inquiries as well as to execute orders based on the metric system. This is readily done by converting into our own equivalents.

"Three-fourths of the world's manufactured goods, and more than a large majority of the machine tools used in Latin America are produced on the system of measurements which we use today.

"As soon as it became known that the Chamber was to consider this subject your committee began to receive in rapid succession communications from prominent manufacturers and representative organizations, all but two of which vigorously condemned the effort to further disrupt our industrial and commercial conditions by inopportune tampering with such a vital basis of production. Among these correspondents might be mentioned The American Hardware Manufacturers' Association, The American Institute of Weights and Measures, "The Iron Age," the American Flexible Bolt Company, The American Spiral Spring & Manufacturing Company, Fawcus Machine Company, Harris Dump & Supply Company, Homestead Valve Manufacturing Company, Keystone Driller Company, Lockhart Iron & Steel Company, Locomotive Stoker Company, J. & J. B. Milholland Company, The McConway & Torley Company, Penn Bridge Company, Pittsburgh Machine Tool Company, Pittsburgh Piping & Equipment Company, H. K. Porter Company, The Simonds Manufacturing Company, Standard Underground Cable Company, James B. Sipe & Company, Union Switch & Signal Company, United Engineering & Foundry Company, Westinghouse Electric & Manufacturing Company, Westinghouse Air Brake Company, The Wilson Snyder Manufacturing Company, The Carnegie Steel Company, and the Rosedale Foundry & Machine Co.

"Only two firms appeared to favor the meter-liter-gram system, and one of these qualifies its opinion by stating: 'Unless the changing over would have an effect that we do not know of.' That effect, as indicated above, would be to practically eliminate from the world's markets the products of the two great commercial nations affected by increasing inefficiency and decreasing production through the changing of standards, gauges, dies, tools, drawings, specifications, patterns, machinery, etc., and the enormous expense incident thereto, at a time when costs are higher, production lower, and demand greater than ever before.



"BE IT THEREFORE RESOLVED, That the Chamber of Commerce of Pittsburgh unqualifiedly condemns all efforts to effect any change in the existing system of weights and measures as impractical and inimical to the trade and general commercial interests of our country, and

"BE IT FURTHER RESOLVED, That copies of this resolution be sent to the Chamber of Commerce of the United States, to our Representatives and Senators in Congress and to the chairman and members of the Committee on Coinage, Weights and Measures, to the American Chamber of Commerce in London, and to the Hon. David Lloyd George. Also to the Chamber of Commerce in San Francisco."

HARD OR SOFT TIRES

There is a good deal of doubt amongst road transport engineers, whether the solid rubber tires used on the majority of commercial vehicles should be hard or soft. Some engineers advocate hard tires—the harder the better—and others are in favor of soft tires; and there are still others who hold that the choice depends upon the condition of the roads and the design of the vehicle, especially in relation to its springs. It may seem curious that this point has not already been cleared up, but the reason is simply that with the usual mechanical drive from a petrol or steam engine there is no means of determining the exact amount of energy supplied to the wheel. Until this is known, the relative efficiencies of different hardnesses of tire cannot be more than guessed at. With electric vehicles the case is different, as the amount of current used can be measured to the minutest fraction and the efficiency of the motors and other parts of the equipment is fixed. Therefore the Electric Vehicle Committee of Great Britain recently decided to organize a series of thorough tests to bring the matter to a conclusive issue. These tests will be of great value to the motor industry in all parts of the world.

The interior of some passenger cars on the Egyptian state railways is cooled by tanks of ice, from which the air is circulated by electric fans.

MARKET DEVELOPMENTS

A Feeling of Uncertainty Pervades the Market

The Advisability of Further Advance in Prices Causes Discussion in Producing Ranks—Exchange Situation Very Unsatisfactory—Supplies Due for an Increase—Machine Tool Activity Largely Through Automotive Industry—Scrap Metal Market Uncertain

NO person would care to predict the market situation of to-morrow. The producing ranks in the iron and steel market have practically started a contest. These forces are about equally divided, one side desiring a further advance in prices, while the other side are attempting to curb this runaway tendency, claiming that in the long run it would be to the pecuniary advantage of all producers if prices are not advanced at the present time.

One concern adheres to its principle that steel prices should not be advanced above the March 21 price, while another concern claims that prices should be $7 a ton higher than those in effect a few months ago.

Machine tool enquiries are still improving. During the past week the placing of orders has kept up at a good rate. Much of this business, however, can be ascribed to the scramble of prospective buyers to take advantage of a few days' grace accorded them by certain machine tool manufacturers who have advanced prices. Since the first of the year practically every line of machine tools has gone up. On some lines two advances have taken place within the past 30 to 60 days. Much of the present activity in machine tool circles is due to the incessant demands of the automotive industries. Various concerns engaged in this line are at present in the market for equipment.

There is some talk that taps, carbon drills, cutters, and other supplies are about due for an increase. While this is not official, it comes from very reliable sources, so that it would not be surprising to see this occur in the near future.

The scrap situation could be summed up in one word: "Peculiar." No one seems to want to state exactly what is going to happen. The exchange rate has the market on red and yellows all tied up. Large shipments of copper are going from England to the States to take advantage of the exchange situation. No. 1 machinery scrap is quoted at $25, but it is well known that the metal would bring more than that. The feeling existing is: "Bring us the material and we will pay the price for it. There is practically none coming in—and those having it are holding for about $40 per ton F.O.B. consumers' mill at Ontario points.

LACK OF RAW MATERIALS THREATENS PLANTS WITH TEMPORARY SHUT-DOWNS

Special to CANADIAN MACHINERY.

MONTREAL, Que., February 11.—Despite the belief that the question of exchange has had the effect of reducing the purchase of materials coming in from the States, the business in general continues to be almost normal. There is, possibly, a decline in the less essential imports, but trading with American houses continues on a comparative heavy scale. Canadian manufacturers report that demands on their lines have shown an increase of late, and this is probably due to the prevailing rate of exchange. Nervousness has been shown in some quarters over the change that has come about in the sharp falling off of British and European trade. The action of the British Government in curtailing imports of many luxuries has reacted on Canadian firms, and this situation will likely continue as long as the financial difficulties are the controlling factor.

Coupled with the depressing nature of the exchange is the evident underproduction of many commodities caused by the disturbed conditions in many industrial circles. Reports from the States indicate that through a lack of sufficient raw materials, due to inadequate car supply, many mills and manufacturing plants are threatened with curtailment or temporary shutdowns. Further than this, shippers may be confronted with a new schedule of higher freight rates as railways everywhere intimate that increases are inevitable. When steel commodities are required to be brought in from the States, coal dealers are confining their purchases to material sufficient to cover immediate needs only. This practice will be followed as long as they are compelled to pay the exorbitant premium of current exchange. Dealers here report a very strong market but refrain from quoting a fixed price on any commodity unless it be for a direct sale. The trend, however, is upward.

Metals Stronger

There continues to be a good demand for all classes of ingot metals and finished sheets, but considerable difficulty is still experienced in obtaining materials, especially in galvanized products. Imports from the States are affected owing to the high exchange rate, and deliveries are very uncertain. Tin has advanced one cent to 71 cents per pound. Spelter shows a similar advance and is quoted at 12½ cents per pound. Antimony at 14 cents represents an advance of 2 cents per pound. Other metals are very firm.

Demand Promises Good Business

Machine tool activity has been a little upset owing to prevailing conditions but the demand is still prevalent and will probably be accelerated once the exchange rate becomes more reasonable. Of course schemes are in operation to minimize the present burden, but the influence is one that tends to hold up business. Calls on Canadian tool manu-

facturers, and dealers who have used equipment to sell emphasize the need for machinery, but the high cost at present is an important factor.

Leather belting and lacings show a strong tone and prices are higher. The discount on extra heavy, single and double, and likewise standard, is now 10 per cent. to the dealer and 6½ per cent. to the consumer. Cut lacings are quoted at $2.25 and $2.75 per pound, and sides at $2 and $2.40 per pound to the dealer and consumer respectively.

Dealers Quote Nominal Prices

Reports of old material dealers are to the effect that business is relatively quiet in most lines. A steady demand for cast scrap is the principal order of the day, and the difficulties of securing this class of scrap is quite pronounced. Dealers are reluctant to quote definite prices as conditions are such that fixed prices are almost out of the question. The nominal quotation on machine cast iron has been advanced $2 to $26 per ton. All scraps, both metals and steels, are firm.

EXCHANGE HURTS BUSINESS HERE

TORONTO. — Between the exchange situation and the difficulty in securing material, there is a feeling of uncertainty in the market this week that is not desirable.

The talk has been for some weeks that the exchange difficulty would right itself in short order—that it was only a temporary displacement, etc.; but the trade is getting weary waiting for that time to come. As a matter of fact, it is not any use disguising the fact that there is no small amount of nasty feeling cropping up over the way in which some of the U.S. firms are insisting on the last pound of flesh in the matter of exchange. Every place the representative of CANADIAN MACHINERY called this week the question of exchange was discussed before anything else, and many of the dealers were outspoken in regard to the situation.

"Here is the way we look at the thing," remarked the manager of one of the largest selling organizations in the Dominion. "There are some firms in the United States to which we are going to send all the business we can get our hands on. There are other concerns that, as far as we are concerned, are not going to get anything. The former class are doing their best to help their Canadian trade in this financial crisis. The only interest the latter class are taking in the matter is to gouge us for the last half per cent. they can on every sale. The firms that are looking to the future, when this matter will come to normal again, are the firms that are going to find the open door here for them. It is a very short-sighted policy, and is much opposed to the idea of building up a trade that is going to be on anything like a firm foundation in the future."

Another dealer put it this way: "We have shipments on the way now in fulfilment of orders that were placed months ago. At that time, we were able to quote a definite price—a thing we do not do now. We allowed a fair margin for the exchange rate, as there was nothing in sight then to indicate that it might go worse. Five per cent., a few months ago, was considered ample allowance. Well, these shipments that are due now will mean lost money for us, as we have quoted a definite price. The difference between the amount we had allowed for exchange and the exchange rate to-day will more than take away the profit that there was for us in the deal. We do not like to keep running after a customer after we have named a definite price, so there is a loss to be met, and we are going to meet this one ourselves."

Of course, this is not done now, as prices are quoted in every case based on the exchange at the time of delivery. As a general thing, the trade is watching this very closely; but there are numerous cases where it is impossible to pass on all the exchange to the consumer, and, in such instances, the dealer or jobber has to lose part of his profits on the business.

Apart from that—and the above has reference largely to the sale of machine tools, where the sums involved are large—there is a nice demand for machine equipment, and a number of sales have been closed that run into nice figures for those handling the orders.

Increases in Supplies

According to reports in the trade to-day, taps, carbon drills and cutters are due for an increase, to become effective on the 23rd of this month. Taps have been selling at 45 off, and the opinion seems to be that the new figure will be 40 off.

Carbon drills to large buyers have been at several prices, although the smaller buyer has probably not secured as close figures. It is likely that 40 and 5 will be the best for any of them now.

Cutters, for some time, have been selling at 10 off, but the chances seem to be that the 10 off will be withdrawn, making the cutters net list. Of course, it must be understood that there has been no official announcement on this, and CANADIAN MACHINERY is simply repeating stories that are current in the trade, at the same time stating, though, that they come from very reliable sources.

There is a nice list out by the Canadian National Railways this week for the Toronto shops. This list is for carbon drills, and calls for 164 dozen of various sizes.

General business is reported as being very good.

Some of the supply departments are going a little more carefully in their purchasing now than they have been in the past. They have, heretofore, ordered enough at one time to keep them going for a normal six months or a year's business. "We are buying for three month periods in our supply department," reported one house this morning. "We figure it out that we would rather run a little short now and then than to get stocked to the neck with goods that might recede in price. There are others, no doubt, who will differ with this policy—and they have very good grounds for so doing, for it is hard to see any drop in sight. The only thing is this—we are doing too much business in this country on the amount of money in circulation."

A Lean Market Here

"Absolutely no improvement." That is the way the steel trade can be sized

POINTS IN WEEK'S MARKETING NOTES

Pittsburgh advices state that the question of prices is causing considerable discussion. At present the forces are about equally divided, making the condition of the market very uncertain.

—

The U. S. Steel Corporation believe that the March 21 price of steel, as set by Industrial Board, should still be adhered to, the 10 per cent. increase in wages granted on February 1 making no difference to the selling price. This decision confirms our statement of last week.

—

Toronto experiences a double trouble. Between the exchange situation and the difficulty of securing material there is a feeling of uncertainty that is far from desirable.

—

The scrap iron situation is likewise uncertain, $25 being the price quoted for No. 1 machinery scrap. Some dealers, however, are holding on for about $40, which proves that there is really no definite price, the feeling being, "Bring us the material and we will pay the price for it."

—

There is considerable talk of an advance on taps, carbon drills, cutters, etc. While this is not official it comes from reliable sources sufficient to warrant attention.

—

A considerable number of machine tool orders have been placed this last week, and the possibilities are for a continuance of this condition. The automotive industry are the chief buyers, several concerns of this nature being at present in the market for new equipment.

—

The chief feature in all markets at present is the uncertain condition existing. No one seems to be desirous of predicting the possibilities, but are content to sit tight and await developments.

up this week; and it is the truth. At the offices of the U.S. Steel Products, the information is given out that they are booking very little, as deliveries are too uncertain. That must not be taken like many of the mills, there is always the chance of a very needy customer getting through.

Plates and sheets have been marked up again this week. One Toronto warehouse was offered plate this week by a premium mill at $4 base Pittsburg, that being the highest price asked yet; but with it went a guaranteed delivery in 60 days. Were that material brought in here by a jobber, it would have to bring a re-sale price of 7 cents.

Some sheets came in this week to local houses, the Hamilton mills being the only place in Canada where any relief can originate.

Get Them Forged

An official of one of the Canadian forging plants, speaking to CANADIAN MACHINERY about the shortage in bars, stated that some places where they were held up for round or square bars were turning to the forging plants for their immediate needs, and in this way were avoiding a shut-down. Forging plants always have experts who could advise regarding this method.

Jobbers admit that the most serious shortage in bars is in the three inch and heavier. Mills are sold out for some time to come on all sorts of bars. In fact, about nine months would be a fairly correct estimate of the time for which their mills are full. One thing that helps out is that there is a fairly warehouses, from which a fairly quick delivery can still be made.

The shortage of tubes is also getting to the stage where it is becoming acute. CANADIAN MACHINERY heard of one firm in a good manufacturing centre in Ontario where they have to close the power plant because they cannot secure the tubes to make the necessary repairs, and they do not wish to operate their plant as it stands now. The peculiar part is that the tubes required are standard three-inch sixteen-foot, and yet, as far as we can learn, none of the stocks were able to supply the demand for this mill.

The exchange situation is troublesome in the steel market; but they simply pass it on to the customer.

The Scrap Metal Market

Prices that are quoted for scrap metal can hardly be accepted as the real strength or weakness of the market, as the case may be. The word "peculiar" describes the scrap metal situation about as well as anything at the moment. No one seems to want to state just exactly what is going to happen. The exchange rate has the market on red and yellows, all tied up. For instance, were an Old Country firm to buy copper in the United States now, instead of paying 19½ cents (the market price) the firm would have to pay 25.76. This means that they are not going to buy. In fact, there are large shipments going from England to the States, to take advantage of the exchange situation.

No. I machinery scrap is quoted at $25; but it is well known that the metal would bring more than that. The reason that the figure is left there is that we could not find a dealer who wanted to name a definite figure as the market price. The feeling is: "Bring us the material—a good tonnage of No. 1 machinery scrap—and we will pay the price for it." There is practically none coming in now, and the dealers that have it—and there are some—are holding for about $40. Of course, that price is f. o. b. consumer's mill at Ontario points.

VARIOUS AUTOMOTIVE PLANTS IN EAST DESIRE MACHINE TOOL EQUIPMENT

Special to CANADIAN MACHINERY.

NEW YORK, February 11.—During the past week the placing of orders for machine tools has kept up at a good rate, but much of the business may be ascribed to the scramble of prospective buyers to take advantage of the few days of grace permitted them by machine-tool manufacturers who have advanced prices. Since the first of the year practically every line of machine tools has gone up, and on some lines two advances have taken place within the past thirty to sixty days. Prices are now on the highest level ever known, considerably exceeding, in many instances, the prices existing during the war period.

While business has been exceptionally good for the past sixty days or more not all in the trade are optimistic as to the future. The sensational drop in foreign exchange and the tightness of the money market are regarded by some as danger signals, and a policy of conservatism among bankers as a result of these events may hold up many industrial projects which have been planned.

Prices on all raw materials and manufactured goods are mounting so high that prices sooner or later must fall of their own weight, due to the withdrawal of buyers. In the iron, steel and machinery trade the possibility of any marked curtailment in demand or reduction in prices does not appear imminent, but as the metal industries are dependent to a large extent on other industries there is some apprehension lest the foreign exchange situation may affect other lines, notably foods and textiles, and in time destroy business confidence, which is the basis for prosperity. It appears certain that exports of American merchandise to Europe will be materially reduced. Actual wants must be provided for, but there has been a great deal of speculative purchasing, which will be eliminated. Denmark is now in complete control of the purchase and sale of exchange, and is thereby regulating imports and exports, and other European countries are likely to take some similar action.

It is singular that much of the present activity in machine-tool circles is due to the incessant demands of the automotive industries. If anything should happen to check the expansion of the automotive industries the machine-tool industry would immediately feel the slack. Among the automotive plants in the East now in the market for equipment are the International Motors Co., which is buying for its three plants at Plainfield and New Brunswick, N.J., and Allentown, Pa.; the Willys Corporation, Elizabeth, N.J., which has been an almost continuous buyer for the past two or three months; the Stevens-Duryea Co., Chicopee, Mass., and its affiliated interest, Rauch-Lang, Inc.; the Rolls-Royce Co. of America, Springfield, Mass.; the Wright Aeronautical Corporation, which will build a new plant at Newark, N.J., for the manufacture of Wright-Hispano airplane motors; the Rochester Motor Co., Rochester, N.Y., which is building an addition to its plant, and others. The Murray Motor Car Co. is moving its plant from Pittsburgh to Newark, N.J., and is expected to buy additional equipment. Companies making gears, transmissions, etc., for automobiles have been especially active, nearly all recently added to their shop equipment. The American La France Fire Engine Co., Elmira, N.Y., is buying tools for motor truck production.

In the export field there has been buying by Fiat of Turin, Italy. The purchases of machine tools in the United States by this Italian company in the past few months total nearly a million dollars, with much more still to be bought. In all the Fiat Company will require about one thousand tools, about half of which will be purchased in the United States. A representative of a large British automobile company is in this country and is reported to be ready to buy a large amount of equipment and automobile accessories and parts.

One of the largest purchasers of small machine tools is the Columbia Graphophone Co., Bridgeport, Conn., which is placing orders for the equipping of its new plants at Toronto, Ont., and Baltimore, Md. Purchases, including woodworking machinery, will aggregate several hundred thousand dollars.

Ottawa.—So far only ten applications have been received by the Air Board for private pilot certificates. The board has announced that all former members of the Royal Air Force are entitled to private pilots' certificates providing they were physically fit when leaving the force. It is advisable for them to submit their applications as soon as possible. A number of applications for airdromes have also been received.

CONTEST EXISTS IN PRODUCING RANKS AS TO WISDOM OF ADVANCE IN PRICES

Special to CANADIAN MACHINERY.

PITTSBURGH, Feb. 11.—Everything in the iron and steel market situation is made by one thing, the fact that there is a contest between two almost equally divided forces in the producing ranks, the two classes being respectively those who do not wish prices to advance and those who wish to secure the highest prices obtainable. All producers are in business for the purpose of making money, but those who object to advancing prices feel that they can see farther ahead than the others, and maintain that in the long run it would be to the pecuniary advantage of all producers if prices were not permitted to advance at this time. The precise mental attitude of those who favor price advances is not known. It may be that they think the added profits now would more than compensate for the losses later, if prices were largely advanced now, or they may have the opinion that the market is marked to go to smash at about the same time, whether or not prices are advanced.

The United States Steel Corporation adheres to its principle that steel prices should not be advanced above the March 21 or Industrial Board schedule, the 10 per cent. wage advance instituted by the corporation as of February 1 not affecting its position a particle. One large independent has pursued up to this date the definite policy that its prices should be the "January 1" prices, i.e., the prices ruling between the post-armistice reduction and the Industrial Board reduction. Another large independent, holding the same general idea, interprets it differently and holds that prices should be $7 a ton higher than those in general effect a few months ago. This means the same thing in most products, as the Industrial Board reductions were $7 a ton on all products except grooved skelp and wire products, in which the reductions were $5 a ton. Last summer all the independents advanced wire products $5 a ton. The second independent mentioned, therefore, regards $3.85 as the proper price for nails, which were $3.50 under the war control and were not reduced at all until the Industrial Board reduction of $5 a ton, this being taken off by the independents last summer. The first independent makes an exception of nails in its adherence to "January 1" prices.

The Steel Corporation and each of the independents mentioned has entered on books very considerable tonnages, for forward deliveries, at prices ruling at time of shipment. They wish to hold prices down, but they do not wish to throw money away if it will do no good.

The other independents occupy either of two positions. Some have not formally advanced prices, but will book no orders, simply promising their regular customers that they will take care of them as best they can, at such prices as they choose to set upon the tonnage when the time comes. Others are quoting higher and higher prices and selling outright such tonnages as buyers will take, all such business being for relatively early delivery, which now means second quarter, as there is practically no rolling space open this side of April 1st.

Thus while the market situation appears on the surface to be a very complicated one, it is readily understood when the governing forces are recognized. In ordinary times, the Steel Corporation has always been able to control the market against advances, though not always against declines. Now steel is so extremely scarce and some buyers are so ready to pay fancy prices, that it is a question whether the Steel Corporation with the assistance of the two large independents referred to above, will be able to control the market, even though their combined tonnage is well above 50 per cent. of the total. The thing will be decided by the relation between supply and requirements, the supply being insufficient now, but capable of a very considerable increase if operating conditions become normal.

Production

The limiting factor in production is transportation. While the labor supply may not be ample, it is at least moderately adequate. The common talk in the iron and steel trade is that transportation is curtailing production, but that is not correct. It is simply restricting production, which has increased, but has not increased as rapidly as if a full supply of transportation had been available.

Throughout January there was much complaint of shortage of cars in the Connellsville region, limiting the shipment and therefore the production of Connellsville coke, and of cars at coal mines, limiting shipment of coal to by-product ovens. Yet the blast furnace reports now show that 15 per cent. more pig iron was made in the United States in January than in December. The increase in steel production was at least as great, and perhaps it was greater, for some steel producers drew upon stocks of pig iron, and developments in the scrap market indicated that there was heavier consumption of scrap than had been counted upon.

Car shortage has also affected the shipment of finished steel products, and at many mills now there are large accumulations of unshipped material. In some cases the accumulations are such that if transportation conditions do not improve, production will be interfered with, as storage facilities are limited.

There is a very strong probability, however, that transportation conditions will improve, for much of the trouble has been due to winter weather, which cannot last much longer. The opinion is commonly expressed that return of the lines to their owners March 1 will bring about a greater esprit de corps and thus increase efficiency.

Ore Prices Fixed

Lake Superior ore prices for the 1920 season have been established by the making of sales at $1 a ton advance over the 1919 schedule, the 1920 prices being therefore as follows: Old Range Bessemer, $7.45; Old Range non-Bessemer, $6.70; Mesabi Bessemer, $7.20; Mesabi non-Bessemer, $6.55 per ton at Lake Erie dock, price being based upon 55 per cent. iron content, natural state, in the case of Bessemer ores, and 5½ per cent. for non-Bessemer ores. The statistics show that about 1.85 tons of ore is consumed per ton of pig iron, so that the cost of making pig iron will be increased about $1.85 per ton. There is an extra in the freight charge on ore from mine to lake dock of 30 cents a net, or about 34 cents a gross ton, imposed as a war measure, which will probably come off, and in that case the benefit will be handed on to the ore buyer. The lake carrying rate will probably be $1 this season, as against 80 cents last season, so that the ore producer gets only an 80-cent advance net. The advance is very moderate, considering all the circumstances. While the new ore prices are about 95 per cent. above their ten-year pre-war average, 1904-13, pig iron is more than 150 per cent. above its corresponding pre-war average.

The common disposition to misuse facts in order to provide price boosting arguments is well illustrated by what is now being commonly said about pig iron prices in connection with this ore advance, it being claimed that pig iron ought to advance $2 a ton for the second half of this year on account of the ore advance, whereas the fact is that pig iron had already advanced $13 to $15 a ton before the ore advance occurred. If the ore producers had appropriated the logic of the blast furnacemen they could have justified an advance of $7 or $8 a ton in ore, on the basis of the pig iron advance.

Sales of foundry iron at $40, valley, seem to have exhausted about all the offerings, but little if anything has been done above that price so far for extended delivery. Basic, however, has sold at $43, valley, a sudden jump of $3. Bessemer remains quotable at $41, valley, with several 200-ton lot sales just made at $43.

A new fly trap for household use employs an electric fan, to be connected to a light socket, to draw insects into a receptacle.

A GOOD BOON

"Geometric Tools are a good boon in our business. Always reliable and sure of turning out a class job; in fact, I don't know how we could secure a decent output without them."

This is what the Works Inspector of a London (England) shop says. He adds that they are making screw and small parts for air craft, and have quite a lot of Geometric Dies in constant use.

Because of the fact that Geometric threading tools are "a good boon" in the thread cutting business, the maority of screw machines and turret lathes are equipped with Geometrics.

The Week's Events in Montreal Industry

C. C. Tennant, of the Hyde Engineering Works, Montreal, has left on a two months' business trip to England.

The Gates Refractories of Montreal have opened a Toronto office in the St. James Chambers, at the corner of Adelaide and Church streets, in charge of J. F. Alexander.

T. W. Lesage has resigned from the position of superintendent of the Montreal waterworks, after being in the services of the city for nearly forty years. H. A. Terreault, of Sorel, has been appointed to the position vacated by Mr. Lesage.

In view of the proposed reorganization of the system of civic government for the city of Montreal, and the fact that the Canadian Manufacturers' Association has not been requested to appoint representatives, the latter body has forwarded a resolution to Premier Gouin, and his colleagues, asking that the Provincial Government provide for representation of the C. M. A. on the Commission.

Joint action has been taken by the Government of Canada and the United States to refer the deepening of the St. Lawrence for navigation, and the utilization of the river for power development purposes. In a note addressed to C. A. Magrath, chairman of the Canadian section of the commission, the Hon. N. W. Rowell stated that the scheme would be made the basis of an investigation, so that the commission may submit a report to the two countries, together with such conclusions and recommendations as may be considered pertinent. The appointment of engineers will be the first step, and they will be empowered to obtain all the necessary data and information, which will be placed in the hands of the commission before the close of the year, and the commission in turn is requested to forward to each Government the final report, with recommendations, not later than three months thereafter.

James Rogers, a veteran railroad contractor, died at his home in Montreal last week, at the age of 83 years. The greater part of his active career was spent in railway engineering work. As a contractor his first work was the construction of the Lake Superior division of the C.P.R., under R. G. Reid, general contractor. Among his other undertakings was the building of the Intercolonial Railway near Chatham, N.B., and double tracking of the Grand Trunk between Hamilton and Niagara Falls. He was likewise superintendent and inspector of many engineering enterprises, both in Canada and the United States.

U.S. SCRAP METAL

Reports from U.S. centres would indicate that scrap metal prices are not in a stable condition. Prices vary slightly, both advances and declines being reported.

PHILADELPHIA.—With the exception of one large sale, the scrap market, although active, has been engaged in the sale of small lots at the current market price. Cast scrap is in demand, and, in some cases, slightly higher prices are asked.

NEW YORK. — Machinery scrap is being sold at last week's price. Stove plate has been advanced 50 cents. This advance is due to a scarcity of general foundry material.

PITTSBURGH.—Heavy melting steel shows a slight decline in price, owing to buyers' requirements having been met for some time to come. The lowest price which seems to have been quoted is in the neighborhood of $28.50 delivered.

BUFFALO. — Scrap iron generally shows little advance, although the market is active and the demand strong. Cold weather has affected the quantity of scrap available.

CLEVELAND.—A slight reaction has set in, prices in general being lower than those reported last week. Heavy melting steel is now quoted at $27 to $27.50, while cast scrap shows a slight advance, now selling at $39 and $40.

CHICAGO.—Prices in general show a tendency to rise, quotations being made at prices above those of a week ago. Considerable activity is apparent, although car shortage is responsible for all shipping difficulties.

ST. LOUIS.—No. 1 railroad scrap is now selling at $39 to $39.50 a ton, an advance of $2.50 over last week's price. Agricultural scrap is quoted at $38.50 to $39.

CINCINNATI.—This market is still active, and prices are remaining about the same, although there is a tendency on the part of some dealers to advance prices.

PIG IRON TRADE

Various U.S. centres report very heavy sales of pig of all grades. Much of this has been for last half delivery.

CLEVELAND.—Foundry and malleable buyers are being placed on rations, and their purchases are being apportioned, so that many have received quantities less than those for which they have been asking. Foundry iron has been selling at between $40 to $41.

PHILADELPHIA.—Foundry iron has advanced in price over former quotations, and is now selling at $43 to $44.25 furnace for last half delivery (2.25 to 2.75 silicon). For first half delivery, some sales have been made at $45.00.

NEW YORK.—A record sale of iron took place during the past week at, in some cases, slightly advanced prices. One producer advanced its base price to $42 from $40 for 1.75 to 2.25 silicon.

PITTSBURGH. — Producers are becoming reluctant to sell, and for this reason the market may be described as quiet. Sales of small lots of No. 2 foundry (1.75 to 2.25 silicon) for prompt delivery are noted as high as $42 furnace.

WELL, WHAT HAS THIS CHAP TO SHOW?

Young Inventor in Seattle Has an Atmospheric Power Generator

Alfred M. Hubbard, a 19-year-old Seattle boy, announced the perfection of an invention he terms an "atmospheric power generator," and made claims that recently caused Seattle's leading electrical engineers, according to newspaper reports, to doubt the evidence of their senses and to pause before they condemned as folly the assertions of the youth.

With the apparatus, in appearance a small coil of wire about 6 inches in diameter, surrounding a permanently magnetic core, 8 inches long, the entire contrivance easily carried in a man's hand. Hubbard gave a demonstration miles from his laboratory that, regardless of the principles involved, several Seattle engineers declared without parallel in electrical history.

An ordinary incandescent electric lamp connected with the two terminals of the "atmospheric power generator" glowed to a cherry red for nearly one hour, and Hubbard volunteered to permit the lamp to burn for as many hours as was necessary to satisfy the most skeptical.

The young inventor claims that there are no moving parts connected with his generator, that there are no hidden batteries, storage or primary, and those who witnessed the demonstration made sure that there was no outside connection with any source of power.

Hubbard's explanation of the phenomenon is that he has succeeded in transforming the earth's lines of magnetic force into electrical energy available for use.

MORROW'S

ALL STYLES OF DRILLS

All **Morrow** Drills made as the highest type of High Speed Drills should be made.

Proper Chip Space
—Note the Difference

Proper Thickness of Webb
—Strength and Accuracy

Scientifically Tempered
—Rigid Inspection

Buy only **Morrow Drills.** The makers guarantee each tool and you get increased production on every drilling operation where **Morrow** Drills are used.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

PRODUCTION BEING SECURED AT NEW PLANT OF CONRADSON MACHINE TOOL CO.

ANNOUNCEMENT has recently been made of the incorporation of the Conradson Machine Tool Company of Green Bay, Wisconsin, of which Mr. C. M. Conradson is president. Mr. Conradson is well known in the machine tool field, at one time being associated with the Gisholt Machine Company of Madison, Wisconsin.

The new concern is associated with Joseph T. Ryerson & Son, who will market the complete output of the new plant, consisting of plain and universal milling machines, selective head lathes, planers and radial drills. "Ryerson-Conradson" is the trade name under which these machine tools are being sold. The new line embodies radical departures from present design of similar machines, and the new features aim to fill present day heavy duty production requirements.

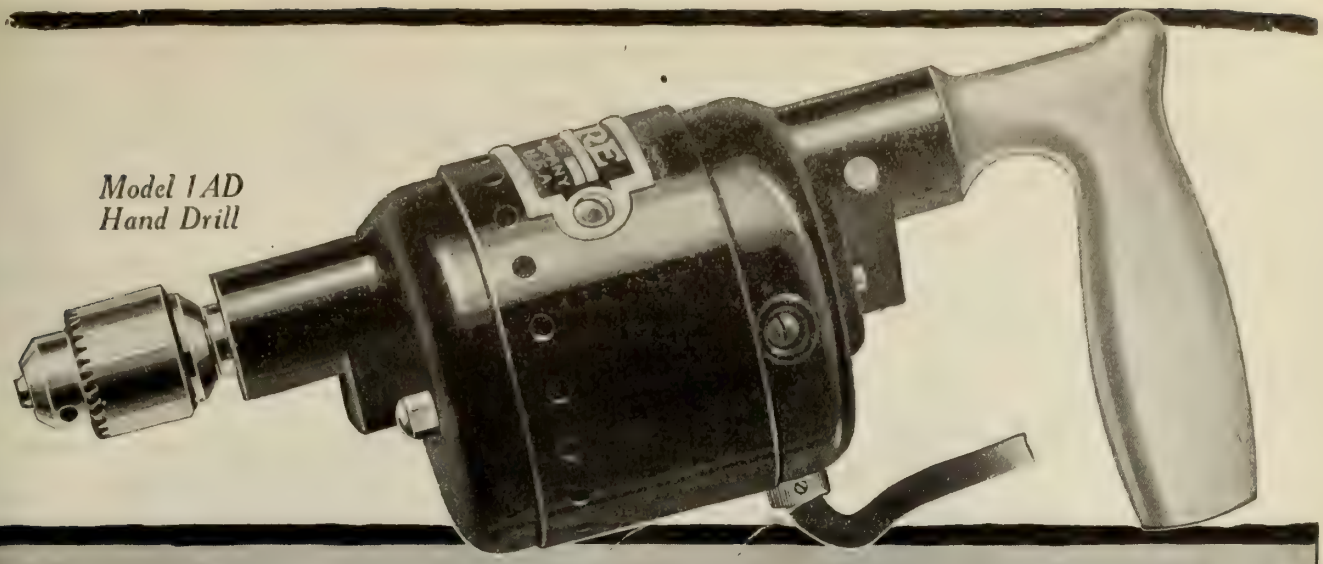
Ground was broken for the Conradson Machine Tool Company plant in the spring of 1918. The building has recently been completed, equipment has been installed, and production is now under way. The plant is ideally located on the outskirts of the city of Green Bay, and the property comprises a ground area of approximately twelve acres on the west bank of the Fox River.

The initial unit of the proposed plan of buildings consists of machine shop and main erecting bay, both of saw-tooth construction, a power house heating plant, and office building.

Joseph T. Ryerson & Son, the selling representatives, have been in business for over seventy-five years, and during the past several years have been making large expansions in the machinery division of their business. They have steel and machinery warehouses at Chicago St. Louis, Detroit, Buffalo and New York, with district offices in practically all of the larger cities, and maintain a foreign selling organization and agents and direct representatives throughout the world.

ABOUT READY TO TURN OUT PLATE

Sydney Plant is Getting Toward the Stage Where Production is Possible



SYDNEY, N.S.—They'll be rolling ship plates in Sydney by February 20.

Information obtained from official sources at the Dominion Steel Corporation's offices is to the effect that the new plate mill will be ready for operation by the 20th of the month. Some minor pieces of equipment have yet to come to hand and be installed, but all is expected to be in readiness for operation by the date named.

The mill, as most people already know, is the first of its kind in Canada It will roll all the plates required for Canadian shipbuilding. The company already has a contract with the Dominion Government for 50,000 tons of plates annually for five years.

NEW PLANT OF THE CONRADSON MACHINE TOOL CO.

Model 1AD Hand Drill

MODEL 1AD Hand Drill

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, brass, aluminum and alloys, 0 to $\frac{3}{16}$ inches.

Motor—Universal, operates on either direct or alternating current. Diameter of motor 3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Drive—Helical gears.

Handle—Aluminum. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

MODEL 2AD Sensitive Drill

Height—18 ins. **Weight** 18 lbs.

Stroke—3¼ ins. **Feed**—Rack and pinion. Helical gear drive.

Capacity—Steel, brass aluminum and alloys, 0 to $\frac{3}{16}$ inch. Drills to center of 7½ inch piece.

Motor—Universal, operates on either direct or alternating current. **Diameter**—3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Thrust—Ball bearing.

Table—Adjustable, may be raised, lowered or swung entirely out of the way. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

Model 2AD Sensitive Drill

MERIT AND DEMERIT MARKS IN C. P. R. FEBRUARY LIST FOR N. B.

S. WINCHESTER, conductor, Woodstock Division, 10 merits. While watching running gear of passing train detected wheel under car not running true. Had train stopped, and upon examination wheel was found to be loose.

E. Bulmer, conductor, Woodstock Division, 5 merits. Vigilance displayed in detecting en route that heater protecting perishable shipment was not burning. He lighted the heater and kept it burning until reaching terminal.

C. Ralston, conductor, Woodstock Division, 5 merits. Detected car with two numbers.

B. A. Craig, conductor, Woodstock Division, 10 merits. Detected car in passing train with truck off centre and king pin broken.

C. Taylor, conductor; J. T. Smith, engineer; C. A. Stewart, fireman; T. F. Griffin, trainman; J. F. Flemming, trainman, Woodstock Division, 10 merits. Good service rendered in handling train with hand brakes after air pump failed, taking train to end of branch run and then making return trip to terminal.

J. P. McMullen, conductor, Woodstock Division, 5 merits. Detached rigging dragging on car.

E. E. Kaine, engineer, Bay Shore, 7 merits. Good service rendered in leaving his engine in charge of fireman and going to assist another engineer to disconnect his engine, which had become disabled between stations.

R. D. Hickey, engineer, Bay Shore, 10 merits. When main reservoir pipe failed had train handled by hand brakes to station, where there was a plumbing shop. Purchased necessary fittings, borrowed a set of dies and effected repairs.

J. A. VanWart, trainman, Woodstock Division, 5 merits. Detected brake beam down on car.

L. O'Hagan, trainman, Woodstock Division, 5 merits. Detected broken arch bar strap and brake rigging dragging on car.

D. M. Slipp, trainman, Woodstock Division, 10 merits. Fired engine Woodstock to McAdam when fireman was taken sick.

Hatfield Burtt, trainman, Woodstock Division, 10 merits. Detected and extinguished fire in heater car.

W. J. St. Thomas, trainman, Woodstock Division, 10 merits. Detected bent anxle on car.

Discipline

Agents (2), 1 demerit. Did not promptly report departure of train.

Agent, 5 demerits. Billed out two cars in violation of embargo.

Head biller, 2 demerits. Showed incorrect destination on waybill pocket.

Car inspector, 5 demerits. Careless inspection of coach, resulting in heater pipes being damaged.

Night clerk, 7 demerits. Responsible for delay to important shipment.

Conductor, 10 demerits. Directed engineer to back up before he received signal from rear of train, or knew that switch was set for siding, resulting in rear of train running through switch and when moving ahead caused derailment of car.

Conductor, 7 demerits. Failed to make wired report of damage to switch which was run through by engine of his train.

Conductor, 10 demerits. Failed to comply with third paragraph of Rule 204.

Checker, 5 demerits. Neglected to turn in tally check of car.

Checker, 6 demerits. Made incomplete "On Hand" list, causing delay in disposing of shipment. Second offence.

Checker, 2 demerits. Incorrect loading of shipment.

Despatcher (reduced to operator). Lack of diligence in watching train movements, which, in a measure, contributed to two trains meeting head on.

Engineer, 15 demerits. Failed to comply with Special Instruction "E."

Engineer, 5 demerits. Disregarded Special Instruction "K."

Hostler, 5 demerits. Responsible for cylinder head blowing out, due to water not being worked out of cylinders.

Operator, 30 demerits. Being absent from duty without permission on Christmas Day.

Operator, 10 demerits. Failed to have a coach lifted by first train as directed, by which neglect heater pipes came to be frozen.

Trainman, 20 demerits. Neglected to place torpedoes as required by rule, when protecting the rear of train.

Train baggageman, 3 demerits. Overcarried locked mail bag.

Trainman, 7 demerits. Failed to turn up retainers on forward portion of train as required by special instructions.

Trainman, 30 demerits. Incorrect reading of train orders handed him by conductor, thereby contributing to head on collision.

Section foreman, 10 demerits. Allowed piped rail to remain in track, which failed under train and caused derailment.

Yard foreman, 5 demerits. Responsible for damage to car by rough switching.

Checker, dismissed. Violation Rule "G."

Conductor, dismissed. Failure to keep clear of superior train by misreading a train order, which resulted in his train colliding with another head on.

Fireman, dismissed. Unwarranted refusal of duty.

Fireman, dismissed. Absent from duty without permission.

Laborer, dismissed. Theft of company's material for which he was tried and convicted.

Night operator, dismissed. Violation Rule "G."

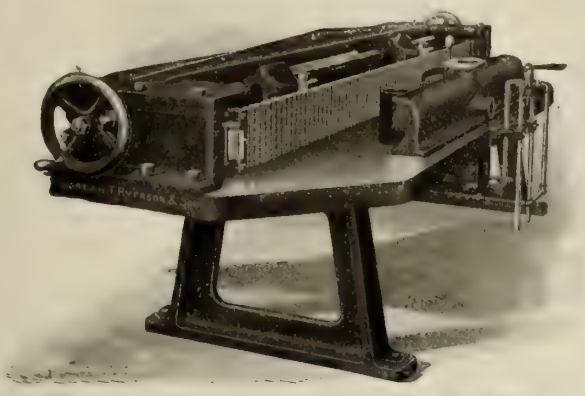
Operator, dismissed. Careless handling of train orders.

On train No. 426, January 1, weld on engine No. 558 gave out in right back corner outside fire box, opening up for about nine inches. Steam and water as a result leaked very badly in the cab, making it almost impossible to see. Engine crew, Engineer Wm. Rhodes, Fireman Thos. Hogan, blocked up hole with curtain and brought train through to terminal on time, although they were themselves drenched with steam and water. Their action was very commendable.

BIG EXTENSION WILL BE MADE TO PLANT OF ALGOMA STEEL

IT is announced that arrangemments have now been completed for the immediate commencement of construction of a new structural steel mill by the Algoma Steel Corporation at Sault Ste. Marie, Ont., at a cost of $6,000,000 to $7,000,000. The product of this new mill is expected to replace the greater part of the present imports of this material. About 90 per cent. of the consumption in Canada of structural steel is now imported, and it is the hope of the Algoma Steel Corporation to supply that, or the greater part of it, from the Sault mills. Work will begin at once, and the construction is expected to take 12 or 15 months. The Corporation already has four blast furnaces, which will furnish much of the steel necessary for the new mill. It is expected that 500 men will be required for the construction work this winter, to be increased to 1,000 in the summer, and when the mill is completed it will require 600 operatives. The immediate financing of the venture is made easy by the possession of ready cash and other liquid funds of the corporation. The last annual report shows current assets of $13,834,842, while the current liabilities were only $2,449,790.

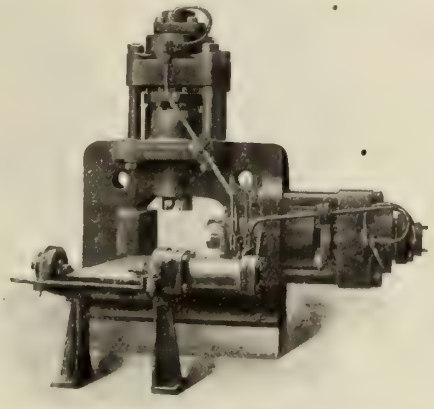
Wanted for Steel Making



The corporation's plans for this mill have been under consideration for some time, but it was doubtless felt that the present enormous demand for steel, together with other favorable conditions, made it desirable to commence operations. In the last report of the Board the plan was thus described:

"During the past twelve months the services of capable constructing engineers were secured to prepare engineering plans for a new universal mill, consisting of a 40-inch blooming mill, 36-inch rougher and three-stand 28-inch

RYERSON



Spring Shop Machinery

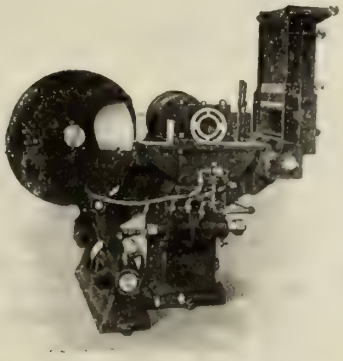
We manufacture a complete line of machinery for the railroad spring manufacturing and repair shops. We will furnish upon request plans and layout of a modern spring shop. Write for complete descriptive bulletin on each machine.

Ryerson Universal Elliptic Spring Forming Machine

This machine will form elliptic spring leaves of any size and curvature used in ordinary practice requiring but one spring maker for its operation.

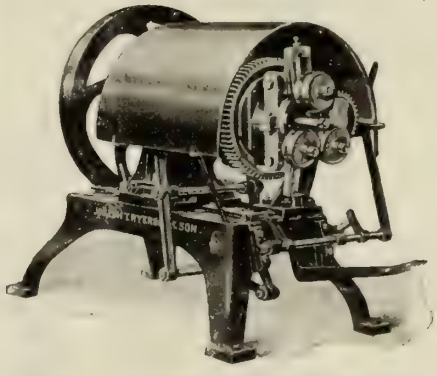
Triple-Pressure Hydraulic Spring Banding Press

This machine is of the triple pressure type capable of exerting a maximum pressure of 100 tons and with minimum and intermediate pressure of 33 and 67 tons.



Flue Shop Equipment

We manufacture a complete line of machinery for cleaning and repairing boiler flues and will furnish upon request layout of a modern flue shop.



Ryerson Improved Universal Flue Cleaning Machine

This machine will clean and cut tubes, both standard and superheater sizes.

Ryerson Combination Hot Saw and Tube Expander

This machine is built in both standard and superheater sizes and will handle three operations in the repair of boiler tubes.

Hartz Superheater Tube-Welding Machine

This machine will handle either standard or superheater tubes with equal facility and economy.

combination structural and rail-finishing mills, all motor driven. This mill, in addition to rolling beams and channels up to 24 inches, will be able to roll a substantial steel rail tonnage to meet the increasing demand for heavier and longer rails.

"Your directors are well satisfied that not only is there prospective business to warrant the proposed new construction, but that the new mills of the kind contemplated are vital to the continued success of the Steel Company. It may be mentioned that at the present time Canada imports all structural steel and and shapes in excess of 35 lbs. per yard."

Sault Ste. Marie.—The work of clearing the ground for the new structural mills has been going on for some time, and every train from the East brings in a new batch of men for the steel plant, but nothing is given out by the company as to plans.

MASSEY-HARRIS CO. OFFERING TO PAY FOR SUGGESTIONS OF EMPLOYEES

THE MASSEY-HARRIS CO., LTD., have issued the following letter to their employees at the various plants, the idea being, as set forth in the letter, to secure greater co-operation from the employees in the betterment of conditions and working arrangements:

To all Factory Employees at
Toronto and Weston Works.

Dear Sirs:—From time to time the company has received from some of the employees who are interested in the efficient and economical operation of the business, various suggestions of improvement in some practical or mechanical feature with which the employee is familiar.

These suggestions have shown the personal interest in the business of the company, of those who made them and have been greatly appreciated by the management.

On the proposal of the employees' representatives on the industrial councils of both the Toronto and Brantford plants, a committee was appointed to investigate and recommend some plan whereby the making of such suggestions might be participated in on a competitive basis by all the employees with some monetary reward for those that were considered worthy.

In view of a favorable report from this committee and with the object of enlisting the personal and active interest and co-operation of not only a few but of every employee in the factory, the directors have decided to offer the following prizes:

One prize	$30.00
One prize	20.00
Two prizes of $15 each	30.00
Five prizes of $10 each	50.00
Fifteen prizes of $5 each ...	75.00
Thirty prizes of $3 each	90.00
Fifty-four prizes, totalling .	$295.00

The prizes will be competitive and will be awarded upon the basis of merit to those who, in the judgment of the Awards Committee submit during the period of January 1st to June 30th, 1920, the most valuable suggestions of plans resulting in more efficient or economical methods of operating the factories of the company under such subjects as:

Improvement of product.
Improvement of manufacturing methods.
Elimination of waste.
Reduction in costs.
Reduction in accident or fire hazard.
Convenience and working conditions.

Prizes will not be awarded for any suggestions which are not regarded of sufficient value for such consideration.

No employee will receive more than one prize for the period. If, however, two or more suggestions are submitted by the same person, the accumulative value of the suggestions will be considered.

Prizes will be awarded only to those who are in the employ of the company at the time of prize distribution.

If similar suggestions are submitted by two or more persons, the one first received shall be given preference.

The decision of the Awards Committee shall be final.

The plan is open to all factory employees not in receipt of monthly salaries. Foremen, assistant foremen and officers of the company are not eligible.

In order to make the plan easily available, a suggestion box will be placed in each department, and all suggestions must be deposited in one of these boxes, from which collections will be made at regular intervals.

Suggestions must be written plainly and on the form provided for the purpose. A pad of these forms will be located at each box, and further supplies can be obtained from the time clerk.

Every suggestion must be signed with the full name and clock number of the employee offering it, and must be addressed to the company and enclosed in a sealed envelope, which will be provided for the purpose.

Employees are requested to give careful thought to each suggestion before submitting it, to explain it clearly though briefly, and to indicate the object to be attained if the suggestion is adopted.

Every employee is earnestly invited to offer suggestions. All of these will have most careful study and investigation in order to arrive at a fair and satisfactory decision as to the merits of each and as to the awarding of the prizes. It is hoped that the interest shown and the talents manifested will be sufficient to encourage the continuance of the system beyond the period proposed.

The success of the plan depends upon the interest and individuality and initiative of the employees who are eligible to take part in the plan.

JOS. N. SHENSTONE,
First Vice-President.

ORGANIZING TO BRING NIAGARA PENINSULA TO ATTENTION OF WORLD

THE municipalities of the Niagara district have organized the Niagara District Industrial Association, with the object of holding, during the present year, an industrial congress. By this means they will endeavor to attract responsible people who may be interested in the power shipping and industrial facilities of the district, and also in the fruit and farm areas. Plans will be made to have their guests visit the power development at Niagara Falls, the Chippawa Power Development, now under way; the Welland Canal enlargement, and the fruit belt. Literature will be prepared describing these outstanding features of the district, and each municipality will also give wide publication to its advantages from an industrial viewpoint. Lists of representative men will be prepared, with the object of inviting them to the congress as the guests of the association.

The officers are:—

President, W. M. German, K.C., Welland.

1st vice-president, H. P. Stephens, Mayor Niagara Falls.

2nd vice-president, E. J. Lovelace, Mayor St. Catharines.

3rd vice-president, George W. Sutherland, Mayor Welland.

Secretary, Louis Blake Duff, Welland.

Treasurer, E. C. Graves, St. Catharines.

Publicity Committee:—W. B. Burgoyne, St. Catharines; F. H. Leslie, Niagara Falls; J. H. Thompson and J. E. Carpenter, Thorold; B. J. McCormick, Welland; P. B. Yates, St. Catharines; H. W. Shore, Port Colborne.

The members of the association are the representatives of the municipal councils of :—

(a) St. Catharines, Niagara Falls, Welland.

(b) Thorold, Merritton, Port Colborne, Bridgeburg, Niagara-on-the-Lake.

(c) Port Dalhousie, Fort Erie, Hubberstone Village, Chippawa.

(d) Crowland, Thorold Tp., Stamford, Bertie, Grantham, Niagara, Louth.

The representatives of the following Trade Boards:

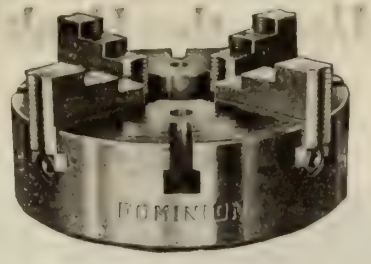
(a) The Niagara Falls Chamber of Commerce.

(b) The St. Catharines, Merritton, Thorold, Welland, Port Colborne, Ridgeway, Fort Erie, Port Robinson and Stamford Boards of Trade.

TRADE GOSSIP

Will Build Foundry.—A building permit has been applied for by the Dominion Steel Products Company, Brantford, for the erection of a new foundry at a cost of $55,000. The building will be 160 feet by 100 feet.

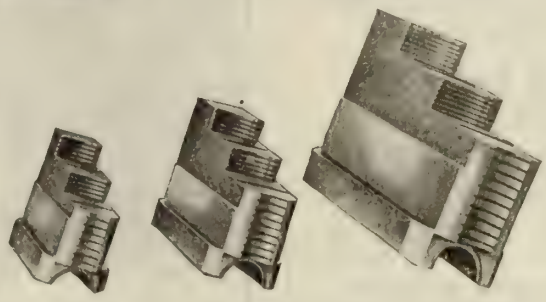
The Canadian General Electric Co. of Peterboro, Ont., contemplate spending between $600,000 and $1,000,000 on new buildings and new equipment. This will include a moulding shop. Work is to commence on the new building in June, and, when completed, will add between a million and a million and a half to the Peterboro' company's payroll.



Hamilton.—W. B. Champ, president of the Hamilton Bridge Works Company, says that owing to the exchange situation they may find it necessary to close the plant, since the price of material that must be bought in the United States is almost prohibitive with the exchange added. Other local firms are also hit hard.

Galt Plant Grows.—For the third time in four years Galt Brass Company has found it necessary to enlarge its plants to handle increased business. Plans have just been prepared for a new foundry building 138 by 58 feet and an extension to vitriol plant 90 by 40 feet. Both buildings will be of concrete, steel and brick construction, and work will be started as soon as weather permits.

U. S. Firms in Canada.—An interesting comparison of the number of outside manufacturing firms having branch factories in Canada has been compiled by the Canadian Trade Commission. This shows that while there are scarcely half a dozen British manufacturers with branch factories here, there are some 530 American manufacturers, whose products range from farm machinery and tractors to packing house products.



Short of Material. — Speaking of shortage of material, a Hamilton despatch says: The high rate of exchange is seriously affecting local industries which have to buy materials from the neighboring republic to any large extent. All importations have to be reduced to a minimum. W. B. Champ, managing director of Hamilton Bridge Works, said that their plant might have to close down owing to inability to secure materials.

Messrs. Hall and Pickles, 64 Port St., Manchester, England, have issued a booklet descriptive of their well-known "Hydra" brand of high speed tool steels. An account is given of the different brands of tool steels made by this firm and the work to which each is adapted, together with instructions for heat treatment. The major portion of the booklet is given over to data relative to high speed steel and tables listing sizes and shapes carried in stock. A valuable feature is seen in the excellent tempering chart and chart of heat colors, which have evidently been prepared with considerable care.

Windsor.—With its stock of coal reduced to but a few tons, the Sandwich Windsor & Amherstburg Railway to-day issued warnings that street railway and power service will be cut 50 per cent unless the fuel situation improves by Monday.

City officials were at a loss to explain just why the company was without coal It was suggested by a member of the Transportation Committee of the City Council that the company had permitted its coal reserve to run down in expectation that the loss, after March 1, would be remedied.

Officials of the company deny this, saying that the Canadian Salt Company, which was under contract to supply power until 1925, had been unable to buy coal.

Plant to Reopen?—The St. Catharines "Standard" says: For several weeks the "Standard" has been asked if the Canadian Steel Foundries plant in Welland was to reopen. We tried repeatedly to get a definite line or the matter, but met with the old reply, "There's nothing definitely decided." However, the rumor has been so consistent that there is something to it. It is stated that it will soon re-open and employ a large staff. The company will begin the making of steel again, and will be in operation by springtime. This is the best piece of industrial news Welland has heard for some time. The plant which employed more hands than any other in Welland was closed last summer for want of business. Recently control in the Canadian Steel Foundries was purchased by New York interests.

DOCKER'S

Elastic Steam Jointing Cement

BLACK DIAMOND OVENS

St. John, N.B.—Among the 1920 estimates of the Canadian Pacific Railway is the construction of a new steel cantilever bridge over the Reversing falls. The new bridge will have a steel span of 443 feet, supported by concrete substructures, and will have a large reinforced concrete approach from the west side. It will be located between the two existing bridges. The substructure work will be carried out this year and the contract for steel let. It is estimated that the bridge will be completed in the summer of 1921. The new structure will be able to support the heaviest trains.

St. John, N.B.—The Canadian Pacific Railway have included as part of their 1920 estimates an extensive programme of work in the New Brunswick district. One of the most important items will be the construction of a new steel bridge over the reversible falls. This bridge will have a steel span of 413 feet, and will be supported by concrete substructures. It will be located between the two present existing bridges. The substructure work will be carried out this year, and the contract for the steel let. It is estimated that the bridge will be completed in the summer of 1921 and will be able to support the heaviest of trains.

Other important work to be accomplished in this section is as follows:

The grain conveyor serving No. 2 berth, Sand Point, will be rebuilt and so placed that ships may be loaded at all tides.

Fredericton is to have a modern station on the present site, and plans are being drawn up in Montreal. A stores building is to be erected at Bay Shore.

The trackage in the Fairville yard is to be enlarged to accommodate the increased business.

Westfield is to have a new station, to be a two-storey wooden structure. It is also the intention of the C.P.R. to build four section foremen's dwellings at different points in Maine and to construct a 100,000-gallon steel water tank at Brownville Junction. While this is being constructed to supply engines with water the object in making it so large is for fire protection. Eighty miles of new rails will be placed on the main line between St. John and Megantic, and the rails taken up will be utilized to replace lighter rails on branch lines in this district. It is estimated that at least seventy-seven miles of replacements will be undertaken. There will also be fifty miles of ballasting done this year along the main line and branch lines.

MARINE

The annual report of the Department of the Naval Service for the year ending March, 1919, showed what Canada has really accomplished in shipbuilding line.

Early in 1917 orders were placed in Canada by the department for 12 patrol vessels, 60 trawlers and 100 drifters. Contracts for 11 trawlers and 30 drifters were placed in Montreal, for 6 trawlers and 20 drifters in Sorel, 6 trawlers and 50 drifters in Levis, 3 trawlers in Three Rivers, 6 trawlers in Kingston, 8 trawlers in Collingwood, 6 trawlers in Toronto, and 14 trawlers in Port Arthur. Contracts for the engines, boilers and auxiliary machinery were made with reliable firms throughout the country and the whole work proceeded with so that the vessels would be available in 1918. Many were available in 1917 and a few of the drifters were sent to European waters with Canadian crews. And this was not the limit of Canada's shipbuilding during the war. Our builders worked for various foreign Governments as well as our own, and during the period of the war built for the Imperial Government 12 submarines, 60 armored trawlers, 100 armed drifters, 550 coastal motor patrol boats, and 24 steel lighters for use in Mesopotamia and shipped there in sections. For the French Government there were built in Canada 6 armed trawlers and 36 motor patrol boats; for the Italians, 6 submarines, and for Russia 1 large armed ice-breaker and some submarines.

PERSONAL

Sault Ste. Marie, Ont.—Captain David Kyle, M.C., vice-president and a director of the Algoma Steel Corporation, died February 8 from pneumonia, following an attack of influenza.

Mr. Irving H. Jones, who is well known in machine tool circles in the Chicago field, has become associated with the machinery department of Joseph T. Ryerson & Son, and will specialize in sales engineering work on the Ryerson line of machine tool equipment.

Mr. G. J. Armstrong, director of the McKinnon Columbus Chain, Ltd., and McKinnon Industries, Ltd., of St. Catharines, Ont., Canada, who has been visiting Australia, returned to Canada during the past month. Edwin Wood Prop., Ltd., represent these manufacturers in Australia.

Mr. Kyle was born in Scotland and came to the Sault in 1910 as engineer in charge of the construction of the merchant mill, and was later in charge of the construction of the gas engines. When that work was completed he joined the staff of the steel plant and was placed in charge of maintenance.

In 1912 he was made general superintendent of operations, and in the fall of 1914 left the service of the company and went overseas and served in the war, during which he won the Military Cross. In 1917, by special arrangement with the military authorities in London, Capt. Kyle was allowed to come back to Canada, and again take his place in the executive offices of the steel company, and two years ago, when Mr. Franz came back to the Sault from Cleveland, Capt. Kyle was elected a director and vice-president of the steel company. Mr. Kyle was about thirty-six years of age, and his death brings a distinct loss to the steel plant and to the city.

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

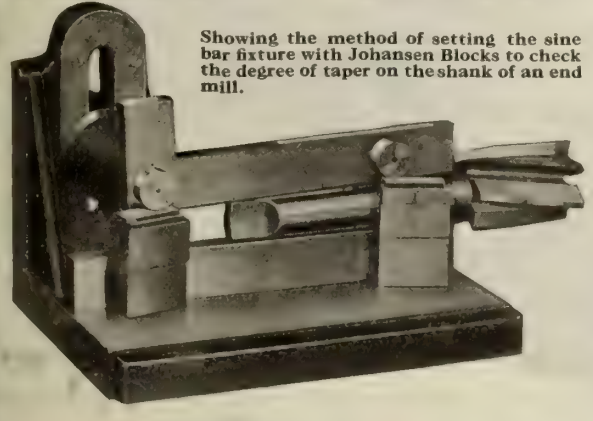
Sine Bar Testing Taper on Plug

T-P Standard Tool Room Specialties

Meeting the Modern Demand



When machining operations are being timed by the stop-watch, then it is that specially-accurate and convenient tools emphasize their advantages.

Cast-iron Box Parallels, Style 160

Steel Parallels, Style 150

Showing the method of setting the sine bar fixture with Johansen Blocks to check the degree of taper on the shank of an end mill.

The Taft-Peirce Manufacturing Company not only offers a complete and accurate line of tool-room specialties, a few of which are here shown, but also designs or makes to order to meet your particular requirement.

The T-P patented Sine Bar Fixture provides a complete device for accurately testing angles. It is invaluable for testing planed or ground work.

Box parallels have a much larger scope than steel parallels and are useful in mounting work for inspection.

T-P steel parallels are made of special steel accurately ground on four sides; they are offered in complete sets, and duplicates are always available from our stock.

Accurate measuring irons are admirable for test and inspection mounts and for holding special work on the machine.

Ask your dealer for T-P Tool-room Specialties. Our Bulletin No. 104E describes them in detail.

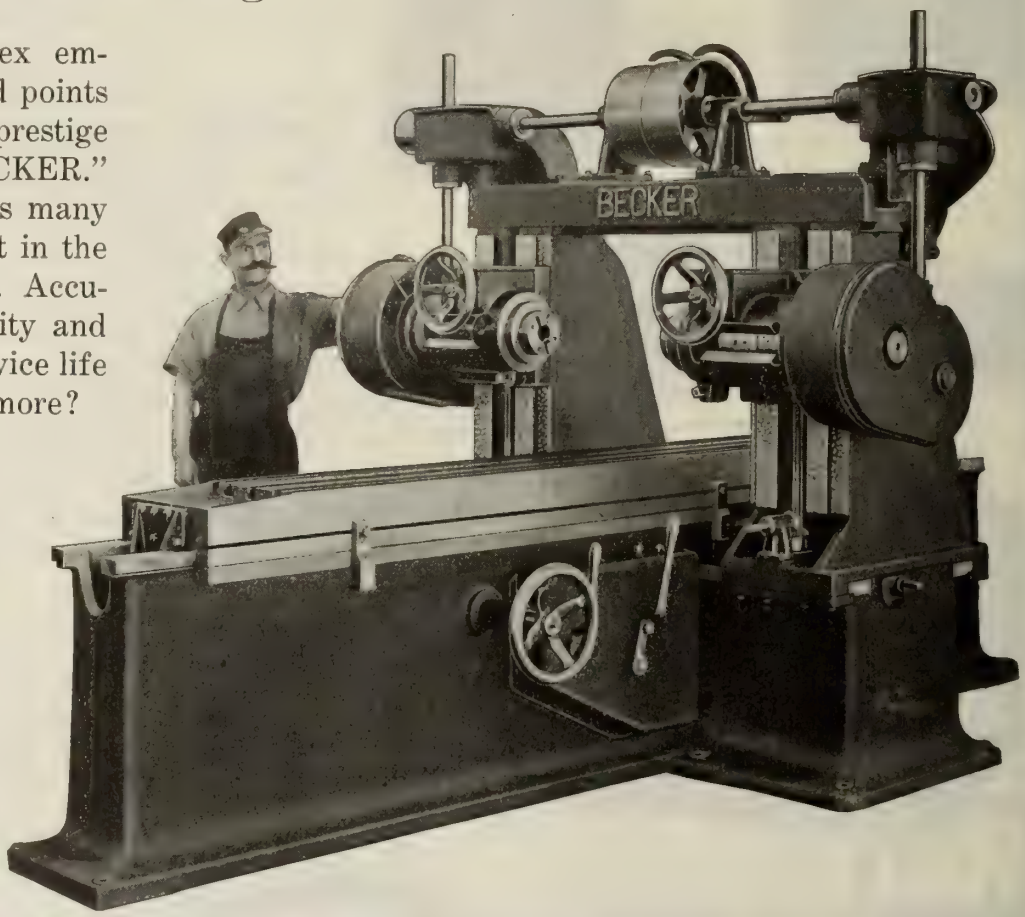
BECKER DUPLEX



26"

(PLANER TYPE MILLING MACHINE)

This machine was especially designed for the makers of automobile motors. It is adapted for the milling of cylinder sides. The extra length of table will easily accommodate two fixtures. While milling the cylinders in one fixture, the operator can be unloading and setting up the second. Vertical spindle can also be applied to this machine so that the cylinder tops can be machined at same setting.

The Becker Duplex embodies all the good points that have given prestige to the name "BECKER." Beyond this, it has many points that place it in the ultra-modern class. Accuracy, speed, stability and extremely long service life —can you ask for more?

We have a Becker Bulletin that explains this machine in detail. You will profit by sending for it.

Stewart No. 10 Cyanide Furnace

For lead or cyanide hardening

Especially suited for the needs of steel engravers and makers of Transfer Rolls, Cutters, Dies, Springs, Chains and other steel parts requiring hard surface without great depth of case.

Stewart Soft Metal Melting Furnaces

Four regular sizes, for capacities of from 25 to 500 lbs.

You Can Judge Them *by* Results

THE fair and reasonable test of any heat treating furnace is RESULTS. If it delivers a uniform and dependable product, at a distinct saving of time, fuel and material, it is an economical investment and a profit-maker for its owner.

Stewart Furnaces for the proper heat treatment of metals come in that classification. For years they have been helping manufacturers all over North America establish and maintain a reputation for high-grade tools, gears, dies, machine parts, etc.

They have proven themselves thoroughly reliable and are result-getters in every sense of the word. They are used for every process; from delicate enameling to the handling of large size machine parts. Manufacturers have saved themselves much worry by letting Stewarts solve their heat treating problems.

Stewart Furnaces cover an extensive range of work. They are adapted for

Annealing
Brazing
Brass Melting
Case Hardening
Cyanide Hardening
Cutter Hardening
Die Hardening
Drop Forging
Forging
High Speed Steel Hardening
Knife Blade Hardening
Lathe Tool Hardening
Milling Cutter Hardening
Oil Tempering
Pre-Heating
Rivet Heating
Rod Heating
Rod End Heating
Reamer Heating
Re-Heating
Soft Metal Melting
Soldering
Spring Hardening
Tempering
Tinning
Tool Hardening

There's a Stewart that will successfully solve the particular heat treating problem of **your** plant. Test it to your satisfaction—let a Stewart work for you 30 days—if it doesn't make good, we will.

Our Catalog No. 75 describes over 150 sizes and types of Stewart Furnaces. You should have a copy handy.

We're "Bulls" *on* Canada

PROSPERITY, rising stock values and a vast amount of "Loose" money,—all these have led to the biggest year of speculation Canada has known—1919. The trading in Montreal exceeded all previous records, and "Everybody's doing it." Stenographers and bank messengers are making a few dollars; financiers and plungers are making their millions. And, don't you forget it, many are losing, too.

In this leading article in the February 1st MACLEAN'S the mania for "taking a chance" is discussed and R. Laird Briscoe tells why there are not many losers—yet. Two men have made $6,600,000—this article tells how simply it's done. One typist bought a $2000 car with a $100 bill. It's really very simple when you know how—**IF** you guess right.

J. K. Munro Says:

THERE will be an election before Fall—it's among the probabilities. Sir Robert Borden took the Premiership with him to South Africa. What will he do with it when he returns? Why didn't he nominate a successor before he left? Why could Sir Thomas White have the job if he wanted it, and why wouldn't he make a good leader to go to the country?

These and other questions are discussed and answered in Mr. Munro's snappy, vigorous, pithy style.

Balking the Bolsheviks

A CANADIAN woman had some extraordinary adventures in Roumania with the Bolsheviks. She is Mme. Pantazzi, and was Miss Ethel Greening, of Toronto. She tells how she and her husband escaped death's door by the narrowest of margins—not once but several times. Incidentally, she tells more of the wonderful adventures of that Admirable Crichton of cosmopolitan free-lances, "Klondyke" Boyle—also Canadian as MacLean's readers know.

Flaherty of Belcher Island

THIS is where the natives wear duck feather kimonas, in a part of Canada which even the geologists and explorers didn't know existed until a few years ago. Of course, you would expect the discoverer to be an Irishman—and in February 1 MACLEAN'S you can read how Flaherty found his island, and what he discovered there—the richest iron ore deposit in the world, but—can it be transported to market?

Other Features are:

"Breed," by Archie P. McKishnie.
"The Thread of Flame," the Basil King serial.
"His Majesty's Well-Beloved," the concluding instalment of the Orczy serial.
"Canada Has a Movie Future," by Allan Dwan.
"Spanish Doubloons," more of Camilla Kenyon's rollicking adventure story.
"Mr. Phipps of the 'Old Firm'," by A. Appleby Terrill.

MACLEAN'S is issued Twice-A-Month

starting with this issue. An important point to remember. If you want to keep up with things **nationally Canadian,** you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 350,000 Canadians Read

NEW AND SECOND HAND MACHINERY

The City of ST. JOHNS QUEBEC

—*Seven railroads, including Canada's great transcontinental lines.*

—*Finest ocean shipping facilities.*

—*Canal connections with New York, the Eastern States, and the Great Lakes.*

—*Cheapest labor market in Canada.*

—*Plentiful supply of skilled and unskilled labor.*

—*Cheap and abundant electric power.*

—*Cheap coal and lower freight rates.*

—*Desirable factory sites with all public conveniences immediately available.*

—*Extraordinary inducements to new industries.*

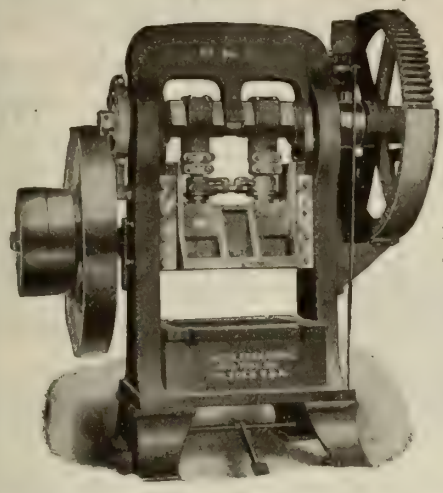
¶ The location of an industrial plant has a vital effect on its prosperity. For a new industry the relative advantages of available sites must be weighed carefully, with keen appreciation of future demands and development.

¶ For every industry there is a logical location, whether it be decided by labor conditions, by the location of raw materials and market, by demands for power, or by special factors peculiar to the business.

¶ Without a knowledge of *your* business or the conditions affecting it, we do not claim that St. Johns is rationally your location; but we *know* that St. Johns possesses extraordinary advantages, that in all probability it is the best site for your plant from every point of view, that you will be running the risk of serious mistake if you do not include this city in your investigations.

¶ We can supply complete and accurate information to any enquiry on St. Johns.

For Detailed Information, write



The Secretary, Chamber of Commerce

St. Johns, Quebec, Can.

The "TOLEDO"

Double Crank Presses

More than meet the demands of production, economy and versatility, they are designed by engineers of extensive experience—to stand up under abnormal stress. The many features which are responsible for consistent performance on all classes of general sheet metal and drop forged work described in detail to those interested without obligation.

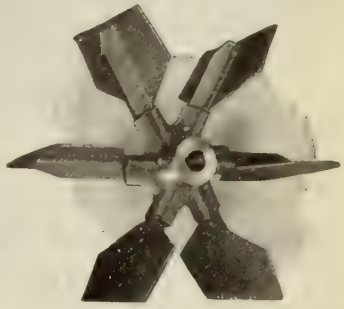
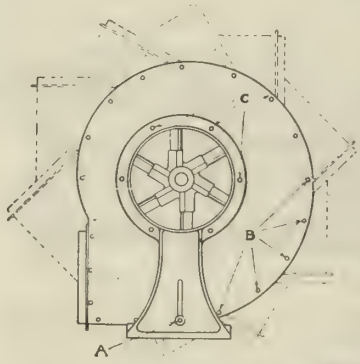
ROCKFORD, ILLINOIS, U.S.A.



Canadian

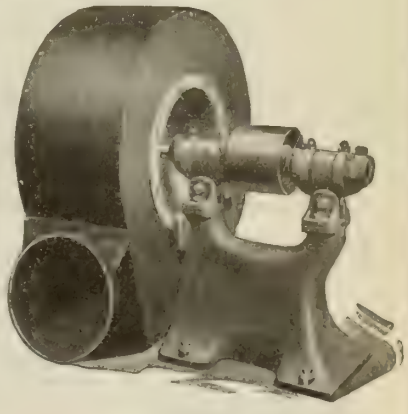


The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.

Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.



The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

NEW AIR-TIGHT BLAST GATE

For Low and Moderate Pressures

"These have given entire satisfaction."
CANADIAN PACIFIC RAILWAY COMPANY
Montreal, Canada

For low and moderate pressures our New Air-Tight Blast Gate easily supersedes the heavy, cumbersome, expensive and slow-acting gate valves and stop cocks.

Costs only a fraction of what you pay for gate valves and stop cocks and saves time and labor.

Write for Circular 123-T. It tells how our blast gate is made, how it works and what users think about it.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

On Your Payroll

WHETHER poring over a blue print, figuring a cost sheet, or mounting a ladder to inspect line shafting, the S K F representative virtually goes on your payroll the minute he enters your plant.

So every S K F man justifies the basic S K F policy. He is a salesman only as he serves.

Not to hear bearings exploited, but to absorb the latest ideas on reducing friction—this is why the manufacturer sends for the S K F sales engineer.

And what more authentic advice is to be had than the engineering knowledge of anti-friction experts, supported by the impartial research of thorough, well-equipped laboratories?

Manufacturers are invited to avail themselves of this service.

Dominion for Quality

DOMINION WHEELS are RELIABLE

Equal Best Imported Wheels

Are you prejudiced against Canadian Grinding Wheels? Then you have not tried Dominion Wheels.

Your poor results with Canadian-made wheels is no doubt due to variation in quality of abrasives bought in the open market.

By manufacturing our own abrasives we are able to secure the desired quality without variation.

It is no longer necessary to import your Grinding Wheels. Dominion Wheels give service second to none. They run uniform to grade and grain. The quality is always the same.

An operator who has had forty years' experience with all makes of wheels informs us that Dominion Wheels are the best that ever came into the shop.

You have nothing to lose by giving them a trial. Send for a wheel or two to-day.

A Standard of Quality in Small Tools

BUTTERFIELD

Taps, Dies, Drills, Reamers, and Milling Cutters

Our concentration for thirty-five years on the construction of tools of the finest quality and our continuous striving towards absolute perfection in the art of tool-making, have resulted in the unexcelled qualities of Butterfield Tools, in their durability and keen-cutting qualities, in the economy which has made them standard equipment in shops which keep a careful check on tool expense.

Follow the Chart for the sake of economy.

The selection of the right blade at the beginning of the work will save time, money and effort all through the job. There's no such thing as an "all purpose" blade, one saw that will cut everything from brass pipe to steel billets, economically. If it were possible, Starrett would have produced such a blade years ago.

The most, and the best that can be done, is to divide all of the material into certain classes — and then design the blade that will cut each group most economically.

The Starrett Hack Saw Chart shows how materials may be grouped and it shows the Starrett Saw that will cut each group cheapest.

Write for a copy of the Chart and Catalog No. 21 "3".

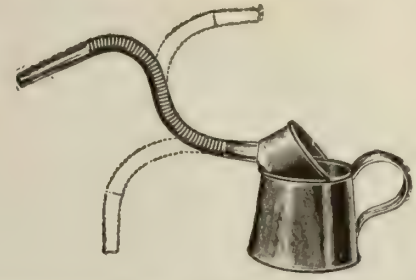
HEPBURN

A high speed, heavy duty planer of superior construction and modern design. Capable of handling the heaviest work with consistent accuracy, rigidity, and speed.

One 42-in. x 12 in. x 10 ft. machine in stock for immediate shipment.

Let us quote you on your requirements in special machinery, cranes, steam pumps, and gray iron castings of every description.



JOHN T. HEPBURN, LIMITED

Engineers and Iron Founders

18-60 Van Horne Street, Toronto, Ont.

Say Good-bye to Funnels Use this "All-WAY" Oiler

Combination Filler and Funnel

This Filler eliminates the necessity of the use of a separate Funnel. With the Flexible Spout any part can be readily reached.

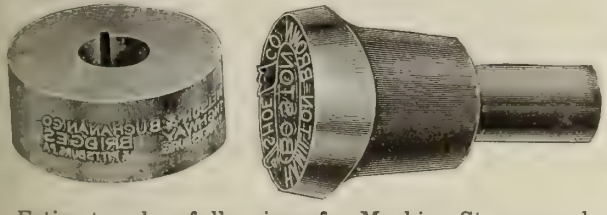
Saves much inconvenience and avoids dripping of oil.

If your dealer cannot supply you, write us.

We also manufacture the well-known "All-Way" Oil Can. Saves you 50% of your oil bill.

THE ALL-WAY OILER MFG. COMPANY

196 King St. West Toronto, Ont.



YALE BRAND

Hand Cut Steel Letters and Figures

The cutting and tempering make or spoil a stamp. Ours are correctly shaped and properly tempered.

Marking Rolls and Machine Stamps

Estimates cheerfully given for Machine Stamps and Marking Rolls, complete or for cutting same only. Also for fancy lettering and special designs; stamps for difficult places and shapes.

The Hoggson & Pettis Mfg. Co.

HIGH SPEED STEEL

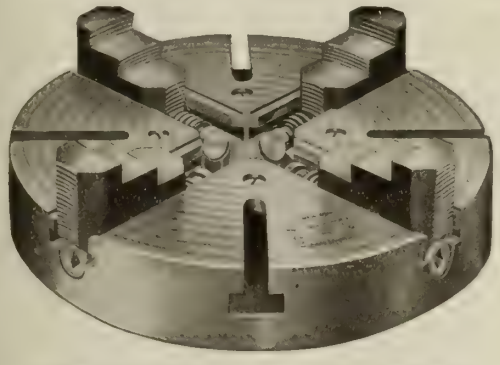
INTRA STEEL *GIBRALTAR STEEL*

Tool Steel for Every Purpose

SWEDISH LANCASHIRE IRON.

Twist Drills, Taps, Hack Saw Blades, Milling Cutters, Files, Etc.
Music Wire for Springs, Steel Balls
Cold Rolled Tool Steel in Strips and Sheets.

We call to your particular attention that we make a specialty of and solicit your inquiries for
Circular Saws—for wood and for hot or cold metal cutting
Machine Knives—for cutting wood, paper, tobacco, agricultural.

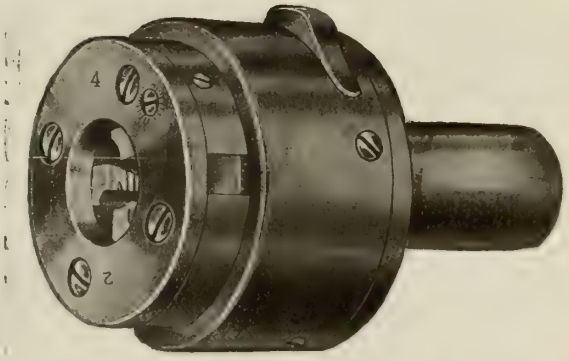


PILOT STEEL & TOOL COMPANY, Limited, 322 St. James St., MONTREAL

Sole Agents for JONAS & COLVER, LIMITED Novo and Continental Steel Works, Sheffield, Eng
H. BOKER & CO., Inc. New York, N.Y.

ALL STEEL

INDEPENDENT CHUCKS



are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.

THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

UNION MANUFACTURING COMPANY
New Britain, Conn.
New York Office: 26 Cortlandt Street
Makers of a complete line of chucks

H & G **Die Heads**

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

THE JOHNSON FRICTION CLUTCH

Standard Single Clutch with Pulley Mounted on Hub

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

BACK IN 1893

we began to sell "BLISS" Presses to what is now the Reliance Metal Spinning & Stamping Co., Brooklyn, N.Y. (then S. Sterneau & Co.) The business has averaged the purchase of a "BLISS" machine a year since. "What do you make on these Presses?" was asked. "Everything," was the answer—indicative of the wide utility of "BLISS" Toggle Drawing Presses.
